Capacitive leakage detectors of the Leckmaster range - General

- with integrated cable break monitoring
- for signalling the presence of electrically non-conductive low-viscosity liquids on the floor of normally dry collection rooms or collection tubs, for example for signalling the presence of fuel oil on the floor of a normally dry tank room or in a collection tub underneath a fuel oil burner

Use of an OWE 2/C capacitive sensor with mounting stand for detection of a leakage in a collection tub underneath a fuel oil burner

The Leckmaster leakage detectors consist of:

- one or several **CPE**, **OWE 2/C** or **COW** capacitive sensor(s) and
- a **Leckmaster 101** or **Leckmaster 155** capacitive relay.

Only one CPE, OWE 2/C or COW capacitive sensor is destined for connection to a Leckmaster 101 capacitive relay.

Up to 5 capacitive sensors can be connected to a Leckmaster 155 capacitive relay.

The **CPE** sensor must be installed on the floor in such a way that the sensor side faces downwards and the label side upwards.

The **OWE 2/C** and **COW** sensors can be mounted either

- upright on the floor (using the mounting stand offered by Jola as an option) or
- freely suspended by their cable above the floor.

The CPE, OWE 2/C and COW sensors should only be used in normally dry surroundings – e.g. in normally dry collection rooms or collection tubs.

The **Leckmaster 101** relay is designed for DIN rail mounting or fastening via 2 boreholes. The various operating statuses are shown by 3 coloured LEDs.

The **Leckmaster 155** relay is designed for surface mounting. The various operating statuses are shown by 5 x 3 coloured LEDs.

Areas of application:

All organic and inorganic liquids with specific dielectric constants between 2 (CPE) or 1.8 (OWE 2/C and COW) and 109.

Prerequisite is that these liquids, dependent on the ambient temperature, are present in fluid form, and that the sensors to be used will be sufficiently wetted.

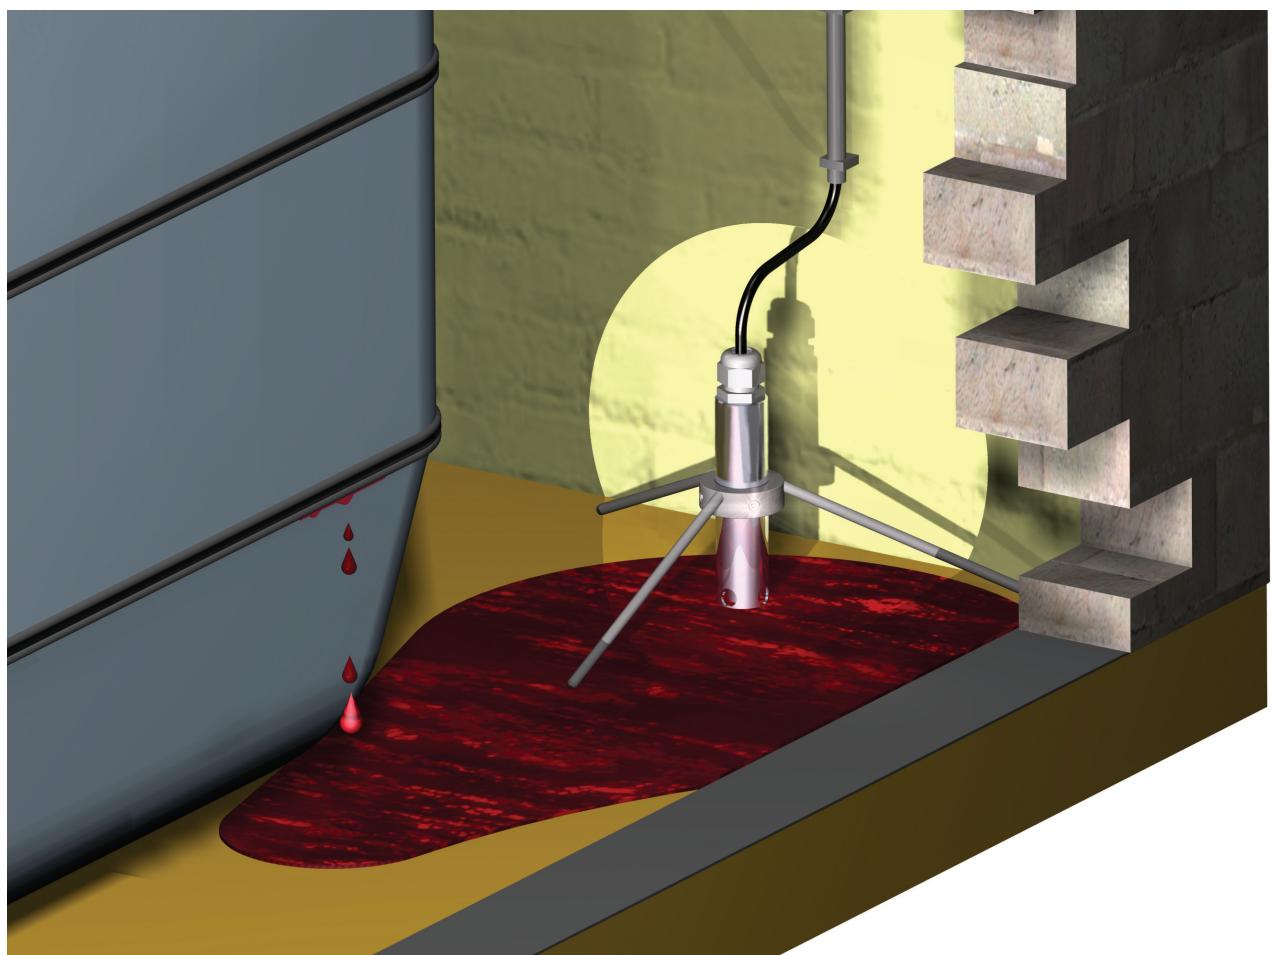

The capacitive measuring principle

The capacitive measuring principle is mainly used for the detection of **electrically non-conductive (insulating) liquids**, but it can also be used to detect electrically conductive liquids.

Electrically non-conductive liquids are generally organic liquids like oils and solvents. An electrode assembly forms a measuring capacitor, and the dielectric is either air or liquid. The dielectric constant of air is 1. The dielectric constant of the liquid to be detected is higher. For our capacitive sensors, the dielectric constant has to be higher than 2 (type CPE) or 1.8 (types OWE 2/C and COW).

The capacitive leakage detector recognises a change in the dielectric constant at the measuring capacitor and an alarm signal is emitted. The design of the measuring capacitor allows direct mounting on the floor and generally rules out the possibility of interference effects due to different subsurfaces.

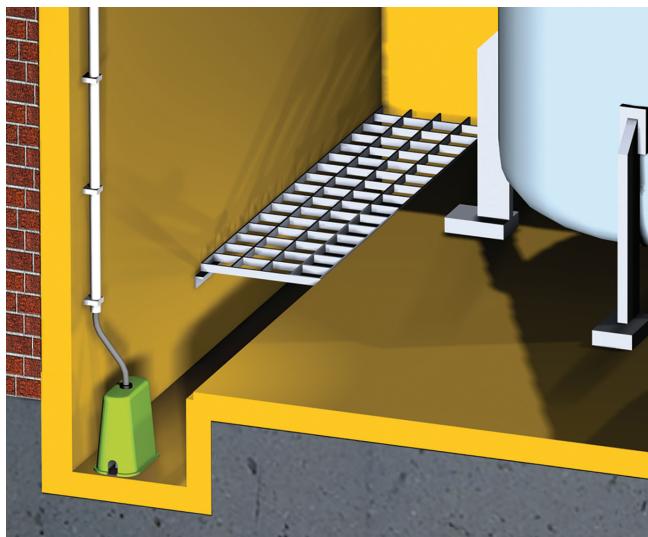

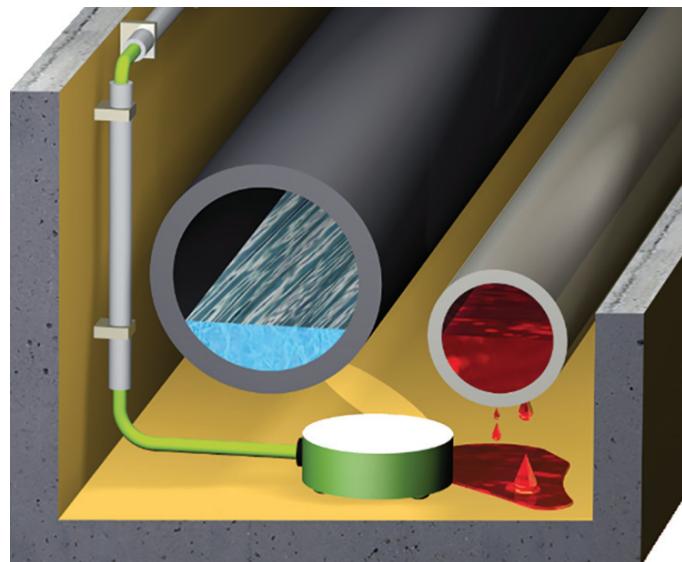

Use of a COW capacitive sensor with mounting stand for leakage detection of an oil leakage in a collection room

Application examples with capacitive sensors

**Use of a CPE capacitive sensor
for leakage detection of a liquid
in a pipe duct**

**Use of an OWE 2/C capacitive sensor
for leakage detection of a liquid
at the lowest point (groove in the picture)
of a collection room**

**Use of a COW capacitive sensor
for leakage detection
in the collection tub of a storage tank
for water-polluting liquids**

Leckmaster 101 capacitive relay

- with DIBt certificate Z-65.40-297

- for connection of 1 CPE, OWE 2/C or COW capacitive sensor
- with cable break monitoring feature and switchable self-hold
- with 1 potential-free changeover contact at the output

Capacitive relay for DIN rail mounting or fastening via 2 boreholes, with connection terminals on top and with 3 LEDs for signalling the operating statuses

The unit is designed for switch cabinet mounting or installation in a suitable protective housing and may therefore only be mounted / installed in these locations. It is suitable for use in clean environments only.

Self-hold:

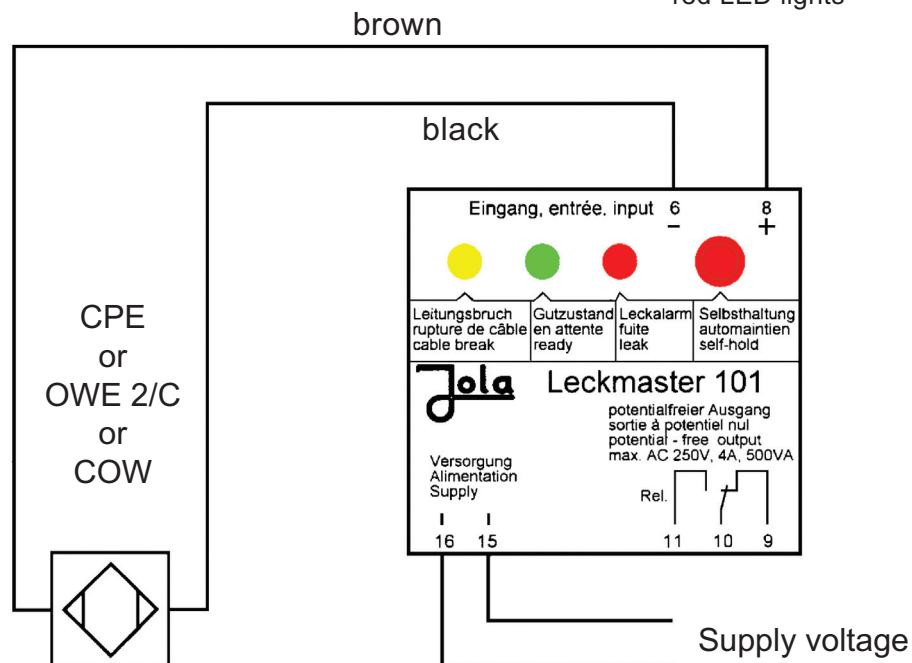

- If the switch **for self-hold is switched on, an alarm is stored.** The relay continues to signal the alarm even if the cause of the alarm (e.g. the presence of water or a cable break) is no longer present – in other words, if the sensor is dry again or if the line has contact. The alarm is acknowledged by switching off the switch for self-hold.
- If the switch **for self-hold is not switched on, the alarm is not maintained** when the cause of the alarm has been remedied but is terminated.

Leckmaster 155 capacitive relay

- for the connection of **5 CPE, OWE 2/C or COW capacitive sensors**
- with cable break monitoring feature
- with touch sensor button for alarm acknowledgement
- with **2 potential-free changeover contacts at the output** and
- with **5 status signal outputs DC 20 V** for the building control system

Capacitive relay in surface-mount housing, with transparent cover, with 5 x 3 LEDs for operating status indication and with 1 LED for acknowledgement status indication, inside the housing

• Signalling lines

The Leckstar 155 electrode relay possesses inputs for the connection of 5 signalling lines. Each line allows the connection of one CPE, OWE 2/C or COW capacitive sensor.

Each capacitive sensor needs a quiescent current to permit cable break monitoring. Each line must therefore be composed of only one capacitive sensor.

The sensor circuits are supplied with a safety extra low voltage generated in the Leckmaster 155 which is reliably galvanically separated from the mains circuit and the potential-free changeover contacts of the two output relays.

All 5 signalling lines have a common system ground, which means there is no galvanic separation of the signalling lines. This factor must always be taken into account in the case of long signalling lines extending into different parts of the building and in particular with the use of COW capacitive sensors and for the detection of conductive liquids.

There is a risk of formation of ground loops if the sensors are mounted in such a way that a sensor can take on ground potential. It may be necessary to perform local potential equalisation in order to avoid potential equalisation currents via the signalling lines.

• Activation of the individual signalling lines

If not all 5 signalling lines are to be used, the signalling lines 2 to 5 can be activated (dip switch in active position) or deactivated (dip switch in inactive position) individually via 4 dip switches. Channel 1 is always activated.

Activation / Deactivation may only be performed in currentless status.

- **Type of indication**

A group of 3 LEDs of different colours is assigned to each signalling line.

Operating status	Type of indication of each signalling line
Power supply	When the supply voltage is switched on, one of the three LEDs on each activated signalling line lights up to indicate the operating status of the activated signalling line in question
Leakage	Red LED lights, if the corresponding activated signalling line reports leakage <ul style="list-style-type: none"> • with effect on the two power circuits • with effect on the corresponding DC 20 V status signal output for the building control system
Standby	Green LED lights, if the corresponding activated signalling line reports standby <ul style="list-style-type: none"> • with effect on the corresponding DC 20 V status signal output for the building control system Only if <u>all</u> activated signalling lines indicate standby <ul style="list-style-type: none"> • with effect on the two power circuits
Cable break	Yellow LED flashes, if the corresponding activated signalling line reports cable break <ul style="list-style-type: none"> • with effect on the two power circuits • with effect on the corresponding DC 20 V status signal output for the building control system
Signalling line switched to inactive	None of the 3 LEDs in the deactivated signalling line (signalling line 2 to 5) lights up.

- **Power circuits**

Two potential-free changeover contacts are available at the output, one of which reacts based on the working current principle and the other on the quiescent current principle. In addition, there is a DC 20 V binary status output signal based on the quiescent current principle for each signalling line for the building control system. The potential-free changeover contact based on the working current principle can be acknowledged via a touch sensor button acting through the housing cover of the unit.

Power circuits	Switching statuses
Output relay 1 in working current principle	Output relay 1 is not energised in currentless status of the Leckmaster 155 and in the standby status of all activated signalling lines. In the event of leakage or cable break in one or more activated signalling lines, output relay 1 is energised if the alarm has not been acknowledged. Output relay 1 can be acknowledged / reset using the touch sensor button.
Output relay 2 in quiescent current principle	Output relay 2 is energised in standby status of all activated signalling lines. Output relay 2 is not energised in currentless status of the Leckmaster 155 and in the case of leakage or cable break in one or more activated signalling lines.
5 status signal outputs (DC 20 V) for the building control system	A DC 20 V binary switching status output signal in quiescent current principle is available for each of the 5 signalling lines: High signal, DC 20 V = standby status of the activ. signalling line Low signal, DC 0 V = <ul style="list-style-type: none"> • currentless status of the Leckmaster 155 or • leakage or cable break in the activated signalling line or • signalling line that is switched inactive The 5 outputs are short circuit-protected and have a common reference ground.

Technical data

Leckmaster 155

Supply voltage (terminals 1 and 2)	AC 230 V, other supply voltage, e.g. DC 24 V, on request approx. 3 VA
Power consumption Sensor circuit (one of the two ground terminals = ground and E1 to E5 = control inputs)	5 terminals under safety extra low voltage, for 5 signalling lines without mutual galvanic separation, with a common ground connection. Connection of the signalling lines is to be made via a 6-core cable and an additional VK 1/5 connection box (see page 31-3-18). Local potential equalisation is to be performed to avoid ground loops in critical installations (see page 31-3-13). DC 8.4 V (safety extra low voltage) < 10 mA 1.5 mA  1.8 mA < 0,15 mA
No-load voltage Short circuit current Response sensitivity Cable break monitoring 1 st power circuit (output relay 1 - terminals 3, 4, 5)	1 single-pole potential-free changeover contact based on the working current principle, for group alarm in the event of leakage or cable break, can be acknowledged via the touch sensor button
2 nd power circuit (output relay 2 - terminals 6, 7, 8)	1 single-pole potential-free changeover contact based on the quiescent current principle, for group alarm in the event of leakage or cable break
Electrical values of the potential-free changeover contacts: • switching voltage • switching current • switching capacity	max. AC 250 V max. AC 4 A max. 500 VA
Status signal outputs for the building control system (one of the two ground terminals = ground and A1 to A5 = control outputs)	5 terminals under safety extra low voltage for DC 20 V binary switching status output signal of each of the 5 signalling lines, without mutual galvanic separation, with a joint ground connection. For connection to the building control system (e.g. PLC) opto-couplers should be fitted for the purpose of galvanic separation. Standby of the signalling line: High signal (DC 20 V) Leakage/cable break/deactivated line: Low signal (DC 0 V) DC 20 V (sufficient for 24 V inputs, as at least 15 V are normally required for High signal) short circuit current limitation with ≤ 30 mA
No-load voltage Short circuit protection

• Acknowledgement via touch sensor button

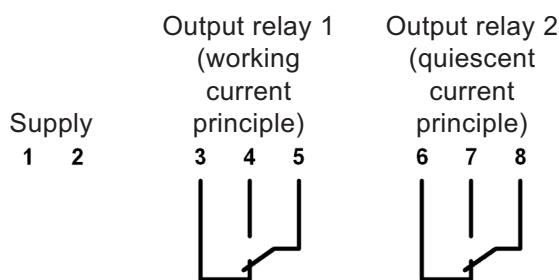

In the event of leakage or cable break in one of more activated signalling lines, output relay 1 is energised and the red LED on the touch sensor button flashes. The operator has to touch the sensor button panel if he wants to acknowledge the signal. Output relay 1 is then de-energised and the red LED reverts to steady.

In this status, new alarms from other signalling lines are signalled only via the optical indicators and the status signal outputs for the building control system of the affected signalling lines. In these cases, however, output relay 1 is not re-activated.

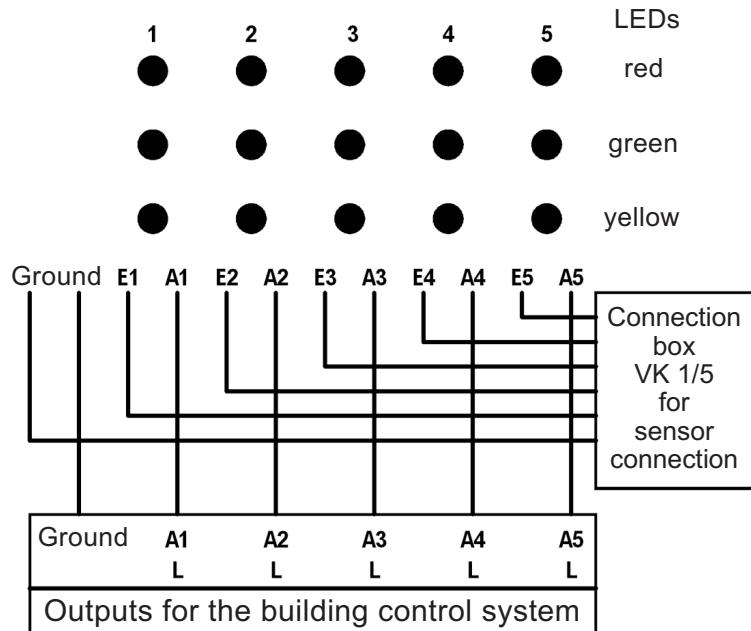

Acknowledgement has no effect whatsoever on output relay 2.
