## Miniature tension/compression force transducer For small measuring ranges from 10 N Model F2221

## Applications

- Construction and apparatus
- Production lines, manufacturing plant
- Measurement and control facilities
- Special equipment and machinery construction
- Cable force measurements

## Special features

■ Measuring ranges $0 \ldots 10 \mathrm{~N}$ up to $0 \ldots 50 \mathrm{kN}$

- Ease of assembly
- Small geometries
- Stainless steel version

## Description

Miniature tension/compression force transducers are designed for static and dynamic measurement tasks in the direct flux of force. They determine the tension and compression forces in a wide scope of applications. It is possible, for example, to measure the actual force in ropes and rods.

The force is applied to this tension/compression force transducer via threaded bolts, which are located on each side of the cylindrical body.

The measurement range starts with a rated force of 10 N .

> Miniature tension/compression force transducer, model F2221

## Note

To prevent overload, it is advantageous to connect up the force transducer electrically during installation and to monitor the measured value. In mounting the force transducer torsion and bending moments have to be avoided.

The force must be applied axial to the centre. Torsion and bending moments must be avoided.

## Option

- High temperature version up to $250^{\circ} \mathrm{C}$
- Cable amplifier $4 \ldots 20 \mathrm{~mA}$ or 0 ... 10 V output
- Other cable length
