Communication Expansion Module

QMC1

INSTRUCTION MANUAL

Shinko

Preface

Thank you for purchasing our communication expansion module [QMC1] (hereinafter referred to as this instrument or QMC1).

This instruction manual (hereinafter referred to as this manual) describes the mounting method, functions, operation method, and handling of this instrument.

Please read this manual carefully and fully understand it before using it.

Also, be sure to give this manual to users of this instrument to prevent accidents due to mishandling.

Notes

- This instrument should be used in accordance with the specifications described in the manual.
  If it is not used according to the specifications, it may malfunction or cause a fire.
- Be sure to follow the warnings, cautions and notices. If they are not observed, serious injury or malfunction may occur.
- The contents of this instruction manual are subject to change without notice.
- Care has been taken to ensure that the contents of this instruction manual are correct, but if there are any doubts, mistakes or questions, please inform our sales department.
- This instrument is designed to be installed on a DIN rail within a control panel. If it is not, measures must be taken to ensure that the operator does not touch power terminals or other high voltage sections.
- Any unauthorized transfer or copying of this document, in part or in whole, is prohibited.
- Shinko Technos Co., Ltd. is not liable for any damage or secondary damage(s) incurred as a result of using this product, including any indirect damage.

SAFETY PRECAUTIONS (Be sure to read these precautions before using our products.)

The safety precautions are classified into categories: "Warning" and "Caution".

Depending on circumstances, procedures indicated by ⚠ Caution may result in serious consequences, so be sure to follow the directions for usage.

⚠ **Warning**	Procedures which may lead to dangerous conditions and cause death or serious injury, if not carried out properly.
⚠ **Caution**	Procedures which may lead to dangerous conditions and cause superficial to medium injury or physical damage or may degrade or damage the product, if not carried out properly.

⚠ Warning

- To prevent an electrical shock or fire, only Shinko or qualified service personnel may handle the inner assembly.
- To prevent an electrical shock, fire, or damage to instrument, parts replacement may only be undertaken by Shinko or qualified service personnel.

⚠ Safety Precautions

- To ensure safe and correct use, thoroughly read and understand this manual before using this instrument.
- This instrument is intended to be used for industrial machinery, machine tools and measuring equipment. Verify correct usage after purpose-of-use consultation with our agency or main office. (Never use this instrument for medical purposes with which human lives are involved.)
- External protection devices such as protective equipment against excessive temperature rise, etc. must be installed, as malfunction of this product could result in serious damage to the system or injury to personnel. Proper periodic maintenance is also required.
- This instrument must be used under the conditions and environment described in this manual. Shinko Technos Co., Ltd. does not accept liability for any injury, loss of life or damage occurring due to the instrument being used under conditions not otherwise stated in this manual.

⚠ Caution with Respect to Export Trade Control Ordinance

To avoid this instrument from being used as a component in, or as being utilized in the manufacture of weapons of mass destruction (i.e. military applications, military equipment, etc.), please investigate the end users and the final use of this instrument.
In the case of resale, ensure that this instrument is not illegally exported.

Precautions for Use

1. Installation Precautions

⚠ Caution

This instrument is intended to be used under the following environmental conditions (IEC61010-1):
 • Overvoltage category , Pollution degree 2
Ensure the mounting location corresponds to the following conditions:
 • A minimum of dust, and an absence of corrosive gases
 • No flammable, explosive gases
 • No mechanical vibrations or shocks
 • No exposure to direct sunlight, an ambient temperature of -10 to 55°C(14°F to 131°F) that does not change rapidly, and no icing
 • An ambient non-condensing humidity of 35 to 85 %RH
 • No large capacity electromagnetic switches or cables through which large current is flowing
 • No water, oil or chemicals or the vapors of these substances can come into direct contact with the unit.
 • When installing this unit within a control panel, please note that ambient temperature of this unit – not the ambient temperature of the control panel – must not exceed 55°C (131°F).
   Otherwise the life of electronic components (especially electrolytic capacitor) may be shortened.
 * Avoid setting this instrument directly on or near flammable material even though the case of this instrument is made of flame-resistant resin.

2. Wiring Precautions

⚠ Caution

 • Do not connect two or more control module QTC1-2P (with power supply / communication option) (hereinafter referred to as QTC1-2P) or QTC1-4P (with power supply / communication option) (hereinafter referred to as QTC1-4P) in one unit.
 • When wiring, do not drop wire scraps into the ventilation window of this instrument.
   It may cause fire or malfunction.
 • When wiring, use a crimping pliers and a solderless terminal with an insulation sleeve in which an M3 screw fits.
 • Tighten the terminal screw using the specified torque.
   If excessive force is applied to the screw when tightening, the screw or case may be damaged.
 • Do not pull or bend the lead wire with the terminal as the base point during or after wiring work.
   It may cause malfunction.
 • This instrument does not have a built-in power switch, circuit breaker and fuse.
   It is necessary to install a power switch, circuit breaker and fuse near the instrument.
   (Recommended fuse: Time-lag fuse, rated voltage 250 V AC, rated current 2 A)
 • When wiring the power supply (24 VDC), do not confuse the polarities.

3. Operation and Maintenance Precautions

⚠ **Caution**

- Do not touch live terminals. This may cause electrical shock or problems in operation.
- Turn the power supply to the instrument OFF when retightening the terminal or cleaning.
  Working on or touching the terminal with the power switched ON may result in severe injury or death due to electrical shock.
- Use a soft, dry cloth when cleaning the instrument.
  (Alcohol based substances may tarnish or deface the unit.)
- As the display section is vulnerable, be careful not to put pressure on, scratch or strike it with a hard object.

The following abbreviations are used in the text, figures, and tables of this manual.

Symbol	Term
PV	Process variable (PV)
SV	Desired value (SV)
MV	Output manipulated variable (MV)
AT	Auto-tuning (AT)
CT	Current transformer (CT) [for heater burnout alarm (option)]

About description of reference page

In the case of "Refer to page 2-2.", it is described as (P. 2-2).

Contents

1 Overview

1.1 Overview of QMC1

This instrument is a communication extension module that can configure a multi-point control system via a host computer or PLC.

A maximum of 16 control modules QTC1-20 (no power supply / communication option) (hereinafter referred to as QTC1-20) or QTC1-40 (no power supply / communication option) (hereinafter referred to as QTC1-40) can be connected via BUS, and a maximum of 64 points can be controlled.

One block connected to BUS is called "1 unit".

In addition, a maximum of 16 units can be connected and a maximum of 1024 points can be controlled.

1.2 Description of Module

(Fig. 1.2-1)
This instrument is the communication expansion module for communication translation and data management.

It is used to configure the control system through the host computer or PLC.

The SIF function (Smart InterFace, programless communication function) enables programless connection to the PLC.

Moreover, it is used also when it configuring the control system of two or more units through the host computer or PLC.

1.3   System Configuration

> ⚠ **Caution**
>
> Do not connect QTC1-2P or QTC1-4P in the same unit.

1.3.1 Connecting to Host Computer [Console selection (MODBUS RTU/SIF function)]

Up to 16 units (QTC1-20 or QTC1-40) can be connected in one unit.

Also, by connecting QMC1, up to 16 units can be connected.

Connection example of QMC1 and QTC1-40
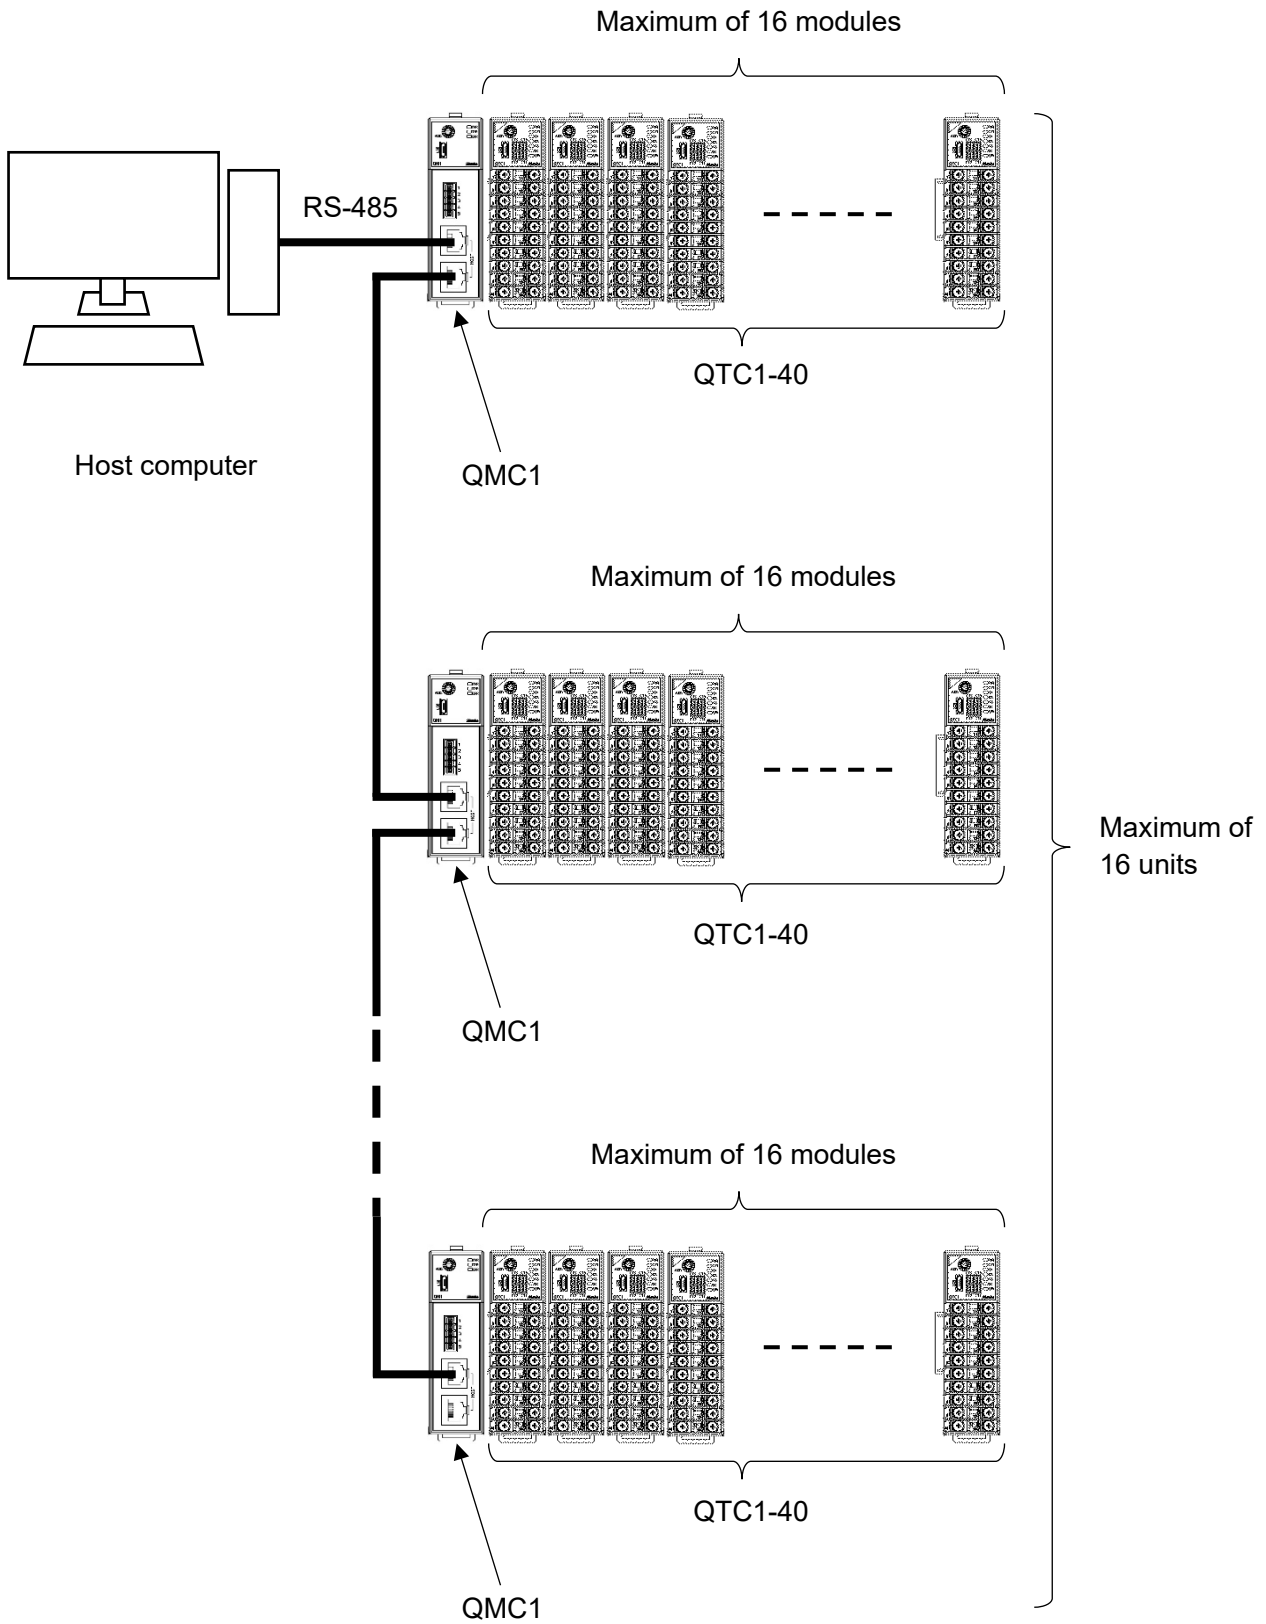

(Fig. 1.3.1-1)

1.3.2 Connecting to Host Computer (C series compatible)

Up to 5 units (QTC1-20 or QTC1-40) can be connected in one unit.

Also, by connecting QMC1, up to 16 units can be connected.

Connection example of QMC1 and QTC1-40
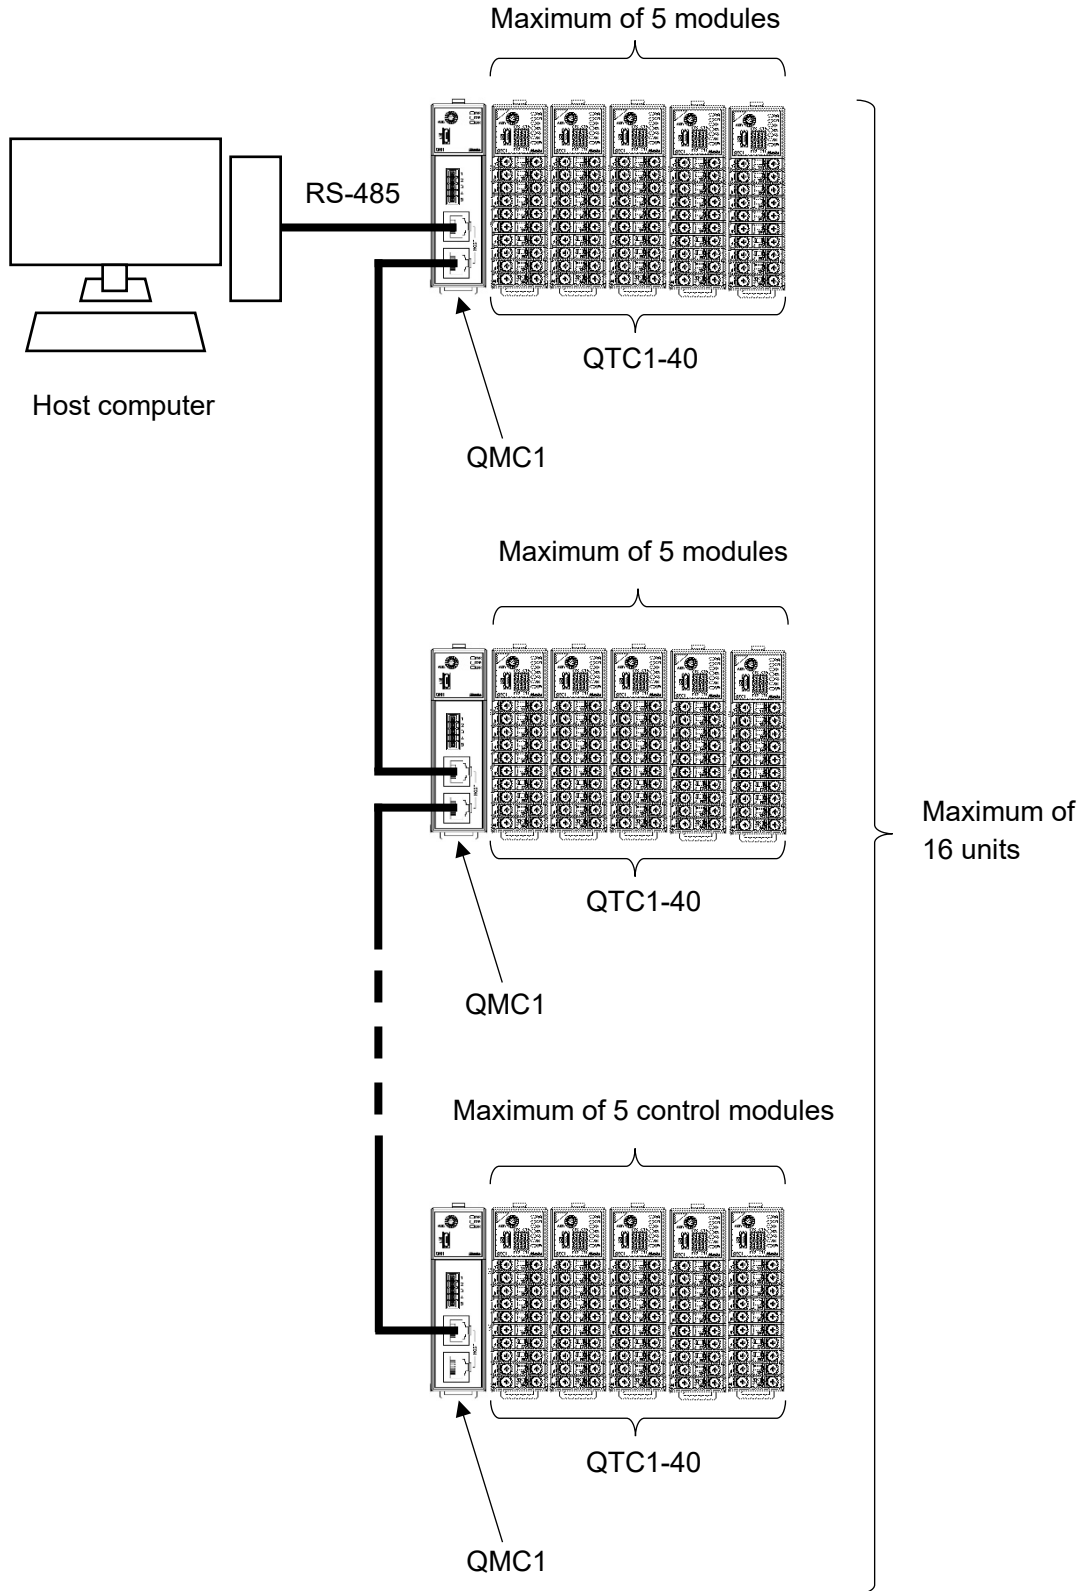

(Fig. 1.3.2-1)

1.3.3 Connecting to PLC [Console selection (MODBUS RTU/SIF function)]

When using the SIF function

One QMC1 is required per unit for upper-level communication, when connecting to a Mitsubishi Electric PLC, OMRON PLC (*) or KEYENCE PLC(*).

The power supply and communication lines to QTC1-20 or QTC1-40 are connected to the BUS using connectors.

Up to 16 modules can be connected.

(*) When using the SIF function to connect to a PLC manufactured by OMRON Corporation or KEYENCE CORPORATION, cannot be connected with RS-485 communication method.

Only RS-422A communication type can be connected.

Connection example of QMC1 and QTC1-40
(Fig. 1.3.3-1)

When not using the SIF function

Up to 16 units can be connected by connecting QMC1 to each other.

Connection example of QMC1 and QTC1-40

Maximum of 16 modules

PLC

RS-485

QMC1

Maximum of 16 modules

QMC1

QTC1-40
(Fig. 1.3.3-2)

1.4   Parameter Passing

The parameters are passed as follows.

Host computer	QMC1
(1) Set and monitor the control module.	(2) Receives sending data from the host computer.
	(3) Returns response data to the host computer.

QMC1	QTC1-☐0
(4) Set and monitor the control module QTC1-☐0.	(5) Receives the sending data from the QMC1 and controls it.
	(6) Returns response data to the QMC1.
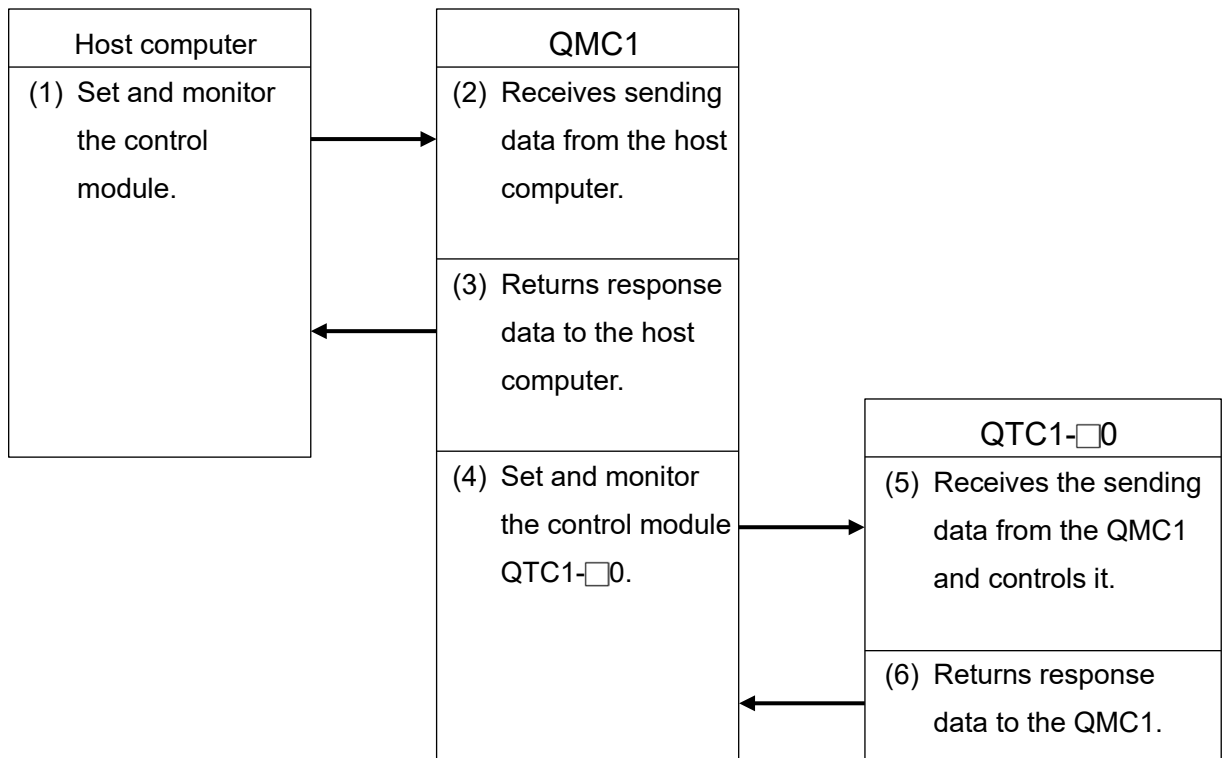

(Fig. 1.4-1)

2 Model

2.1 Model

QMC1		-▢▢	▢	-▢	
Communication type	C4				RS-422A
	C5				RS-485 (*1)
Event input/output (Option)		0			No option
		1			Event input (4 points) (*2)
		2			Event output (4 points) (*2)
		3			Event input (2 points), Event output (2 points) (*2)
Communication protocol			0		Console selection (MODBUS RTU/SIF function) (*1)
			1		C series compatible

(*1) When using the SIF function to connect to a PLC manufactured by OMRON Corporation or KEYENCE

CORPORATION, cannot be connected with RS-4855 communication method.

Only RS-422A communication type can be connected.

(*2): The plug side (wiring connector) of the event input / output connector is sold separately.

2.2 How to Read the Model Label

The model label is attached to the right side of this instrument.

Model

Power supply voltage, power consumption

Serial number

3 Name and Functions
(Fig. 3-1)

Operation indicator

No.	Symbol (color)	Name and Function
①	PWR (Green)	**Power indicator** • Lights off (always): No power supply to the instrumen • Lights up (always): Power supply to the instrumen • Flashing for 500 ms (3 seconds): Warming up the instrument • Flashing for 500 ms (always): Non-volatile IC memory error
②	T/R (Yellow)	**Communication indicator** • Lights off (always): Communication error (no response) or USB communication • Flashing (slow): Communication error (reception error) • Flashing (fast): Communication is normal
③	ERR (Red)	**ERR indicator** • Lights off (always): No abnormality • Lights up (1 second): After warming up, communication abnormality with the connected module (e.g.) If the host computer or PLC sends data out of the set range, the ERR indicator will light up for 1 second depending on the negative acknowledgement from the connected module. • Flashing for 250 ms (always): when powered by bus power from the PC

Switch and connnector

No.	Symbol	Name and Function

④	ADD.	**Module address selection rotary switch**
		
		Rotary switch for module address selection.
		
		• QMC1-▢▢▢-0 [Console selection (MODBUS RTU/SIF function)]
		
		   The module address is the value of the selected rotary switch plus one.
		
		• QMC1-▢▢▢-1 (C series compatible)
		
		   The module address is the value of the selected rotary switch.

⑤	USB	**Console communication connector** Connector for console communication tool cable.
⑥		**Event input/output connector [0225-3705 (by DINKLE)] (Option)** Connector for ervent input or event output. Operation is selected by event input assignment selection or event output assignment selection.
⑦		**Serial communication connector [Modular jack (RJ45)]** Modular jack for connecting to the host computer or PLC. This modular jack is used for connection with the QMC1, when connecting two or more units.
⑧		**Communication specification selection dip switch** DIP switch for selecting communication specifications. Select communication speed, data bit, parity and stop bit.

4 Procedure Before Starting Operation

The procedure up to the start of operation when connecting to a host computer is shown below.

Preparation of communication program	A communication program is required to connect and use the host computer. Refer to "10 MODBUS Protocol (P.10-1 to P.10-5)", to create the communication program.
Selection of communication specifications	Select the communication specifications such as communication speed, data bit, and parity. Refer to "5.1 Selection of Communication Specifications (P.5-1, P.5-2)".
Selection of module address	Select the module address. Refer to "5.1.2 Selection of Module Address (P.5-3)".
Mounting	Mount the QMC1 to the DIN rail. Refer to "6.3 Mounting (P.6-3 to P.6-5)".
Wiring	Wire the QMC1. Refer to "7.3 Wiring (P.7-5 to P.7-7)".
Connecting the host computer to QMC1 and control module QTC1-□0	Connect the QMC1 and control module QTC1-□0 to the host computer. Refer to "7.4 Connection of QMC1 and Control Module QTC1-□0 to Host Computer (P.7-8, P.7-9)".
Setting of specification	Set the items of through USB and the event input/output items. Refer to "8 Setting of Specification (P.8-4 to P.8-19)".
Setting of control parameters	Set QTC1-□0 control parameters such as SV and alarm. Refer to "11 Communication Command List (P.11-1 to P.11-87)". When using with C series compatible, refer to "13.4 Communication Command List (P.13-6 to P.13-10)".
Operation start	Send the control enable command and start operation. Refer to "12 Operation (P.12-1 to P.12-7)".

(Fig. 4-1)

5 Communication Parameter Setting

5.1 Selection of Communication Specifications

Use the communication specification selection dip switch on the left side of this instrument to select communication specifications.

Communication specification selection dip switch
(Fig. 5.1-1)

Select the communication speed, data bit, parity and stop bit.

All are off when shipped from the factory.

- Communication speed: 9600 bps
- Data bit: 8 bits
- Parity Enable/Disable: Enable
- Parity Even / Odd: Even
- Stop bit: 1 bit

(1) Communication speed

Communication specification selection dip switch		Communication speed
1	2	
OFF	OFF	9600 bps
ON	OFF	19200 bps
OFF	ON	38400 bps
ON	ON	57600 bps

(2) Data bit

Communication specification selection dip switch	Data bit
3	
OFF	8 bits
ON	7 bits

(3) Parity Enable/Disable

Communication specification selection dip switch	Parity Enable/Disable
4	
OFF	Enable
ON	Disable

(4) Parity Even/Odd

Communication specification selection dip switch	Parity Even/Odd
5	
OFF	Even
ON	Odd

(5) Stop bit

Communication specification selection dip switch	Stop bit
6	
OFF	1 bit
ON	2 bits

Dip switches No.7 and No.8 does not use. Leave it OFF.

5.2 Selection of Module Address

> ⚠️ **Caution**
>
> - The QMC1 module address selection is required to communicate with the host computer or PLC.
>   The QTC1-20 or QTC1-40 module address selection is required to communicate with the QMC1.
> - The module address of QMC1 differs depending on the model name.

The module address is selected with the rotary switch.

Module address selection
rotary switch
(Fig. 5.2-1)

Use a small flat blade screwdriver to select the module address.

The module address of QMC1 differs depending on the model name.

For QMC1-☐☐☐-0 [Console selection (MODBUS RTU/SIF function)]

When using the SIF function, it is not necessary to select the module address.

Leave it at 0.

Module address: 0 to F (1 to 16)

Value of rotary switch	0	1		9	A	B		F
Module address	1	2		10	11	12		16

For QMC1-☐☐☐-1 (C series compatible)

The value of the selected rotary switch becomes the module address.

Module address: 0 to F (0 to 15)

Value of rotary switch	0	1		9	A	B		F
Module address	0	1		9	10	11		15

6 Mounting

⚠ Caution

- Do not connect QTC1-2P or QTC1-4P in the same unit.
- For the QMC1-☐☐☐-1 (C series compatible), the maximum connection "modules / channels" is "5 modules / 20 channels".
- Mount the DIN rail horizontally.
- This instrument fits the following DIN rails.
  Top hat rail TH35 JIS C 2812-1988
Width: 35 mm
Height: 7.5 mm or more
Groove width: 23 mm or more
DIN rail mounting screw height:
  6 mm or more
  (For DIN rail height 7.5 mm)

(Fig. 6-1)

- If this instrument is mounted in a position susceptible to vibration or shock, mount commercially available end plate at both ends of the instrument.
- When installing, make sure that the orientation (upper and lower) of this instrument is correct.
- When mounting or removing this instrument on the DIN rail, it must be tilted slightly.
  Secure a space of 50 mm or more in the vertical direction of the instrument, considering the wiring space of the power supply/communication line and heat dissipation.

Spacing when QMC1 and QTC1-40 are connected
(Fig. 6-2)

6.1　Selection of Location

[Ensure the mounting location corresponds to the following conditions:]
- A minimum of dust, and an absence of corrosive gases
- No flammable, explosive gases
- No mechanical vibrations or shocks
- No exposure to direct sunlight, an ambient temperature of -10 to 55°C that does not change rapidly, and no icing
- An ambient non-condensing humidity of 35 to 85 %RH
- No large capacity electromagnetic switches or cables through which large current is flowing
- No water, oil or chemicals or the vapors of these substances can come into direct contact with the unit.
- When installing this unit within a control panel, please note that ambient temperature of this unit – not the ambient temperature of the control panel – must not exceed 55°C.
  Otherwise the life of electronic components (especially electrolytic capacitor) may be shortened.

* Avoid setting this instrument directly on or near flammable material even though the case of this instrument is made of flame-resistant resin.

6.2　External Dimensions (Unit: mm)
(Fig. 6.2-1)

6.3 Mounting

Mounting to the DIN rail

① Lower the lock lever of this instrument. (The lock lever of this instrument has a spring structure, but if lower it in the direction of the arrow until it stops, it will be locked in that position.)

② Hook the part ② of this instrument onto the top of the DIN rail.

③ Insert the lower part of this instrument with the part ② as a fulcrum.

④ Raise the lock lever of this instrument.
Make sure it is fixed to the DIN rail.
(Fig. 6.3-1)   (Fig. 6.3-2)

Removal from the DIN rail

① Insert a flat blade screwdriver into the lock lever of this instrument and lower the lock lever until it stops.

② Remove this instrument from the DIN rail by lifting it from below.
(Fig. 6.3-3)

Mounting multiple modules to the DIN rail

This section describes an example of mounting this instrument and QTC1-40 on the DIN rail.

① Lower the lock lever of the QTC1-40, and mounting the QTC1-40 to the DIN rail.

② Slide the QTC1-40 to the left and connect the connectors to each other.
(Fig. 6.3-4)

③ Raise the lock lever of the QTC1-40.
Make sure it is fixed to the DIN rail.
(Fig. 6.3-5)

Removal multiple modules from the DIN rail

This section describes an example of removing multiple QTC1-40 on the DIN rail.

① Insert a flat blade screwdriver into the lock lever of the QTC1-40 and lower the lock lever until it stops.

② Slide the QTC1-40 to the right side and disconnect it from the connector, then remove it from the DIN rail.
(Fig. 6.3-6)

7 Wiring

> ⚠ **Warning**
>
> Turn off the power supply to this instrument before wiring.
> If you work while the power is supplied, you may get an electric shock, which could result in an accident resulting in death or serious injury.

> ⚠ **Caution**
>
> Do not connect QTC1-2P or QTC1-4P in the same unit.

7.1 Recommended Terminal

Use a solderless terminal with an insulation sleeve in which an M3 screw fits as shown below.

Specify 0.5 N•m for the tightening torque.

Solderless Terminal	Manufacturer	Model	Tightening torque
Ring-type	Nichifu Terminal Industries Co., Ltd.	TMEV1.25-3	0.5 N•m
	Japan Solderless Terminal MFG Co., Ltd.	V1.25-3	
(Fig. 7.1-1)

7.2 Pin Assignment and Terminal Arrangement

7.2.1 Pin Assignment of Event Input/Output (option) and Serial Communication Part
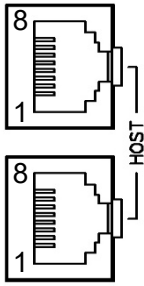

(Fig. 7.2.1-1)

(1) Pin assignment of event input / output connector

Pin No. \ Model	QMC1-☐☐1-☐	QMC1-☐☐2-☐	QMC1-☐☐3-☐
1	I1 (Event input 1)	O1 (Event output 1)	I1 (Event input 1)
2	I2 (Event input 2)	O2 (Event output 2)	I2 (Event input 2)
3	I3 (Event input 3)	O3 (Event output 3)	O1 (Event output 1)
4	I4 (Event input 4)	O4 (Event output 4)	O2 (Event output 2)
5	COM	COM	COM

(2) Pin assignment of serial communication connector

Upper connector and Lower connector are common.

Pin No. \ Model		QMC1-C4☐-☐	QMC1-C5☐-☐
	8	NC	NC
	7	SG	SG
	6	RD(+)	NC
	5	SD(+)	YB(+)
	4	SD(-)	YA(-)
	3	RD(-)	NC
	2	SG	SG
	1	NC	NC

Power Supply
(Fig. 7.2.2-1)

7.3 Wiring

7.3.1 Wiring for Power Supply

The terminal block for power supply and serial communication is located on the base of this instrument.

Wiring by the following procedure.

(1) Case removal

① Push the release lever on the top of this instrument to unlock it.

② Remove the case.
(Fig. 7.3.1-1)

(2) Wiring
⚠ **Caution**

• Do not confuse the polarities.
• Use the ring-type solderless terminal.
• The tightening torque should be 0.5 N•m.

Power supply

24 V DC

(Fig. 7.3.1-2)

(3) Case mounting

① Hook the case on the lower part ① of this instrument.

② Mount the case so that the lower part ① of this instrument is the fulcrum and covers the release lever.
There is a clicking sound.

7.4   Connection of QMC1 and QTC1-□0 to Host Computer

> ⚠ **Caution**
>
> Do not connect QTC1-2P or QTC1-4P in the same unit.

For the connection between the host computer - QMC1 and between QMC1 - QMC1, use the following communication cables (sold separately).

Between host computer - QMC1

  USB Communication Cable (CMC-001-4) [USB - Modular]

  Communication Cable (CQM-001) [Y terminal (C5, 3-wire) - Modular]

  Communication Cable(CQM-002) [Y terminal (C4, 5-wire) - Modular]

Between QMC1 - QMC1

  Communication Cable(CQQ-001) [Modular - Modular]

7.4.1 Wiring Example: When Using the USB Communication Cable CMC-001-4 (Sold separately)

  Connection example of QMC1 and QTC1-40
(Fig. 7.4.1-1)

7.4.2 Wiring Example: When Connecting Multiple Units

Use the communication cable CQQ-001 (sold separately) to connect the units.

Connection example of QMC1 and QTC1-40
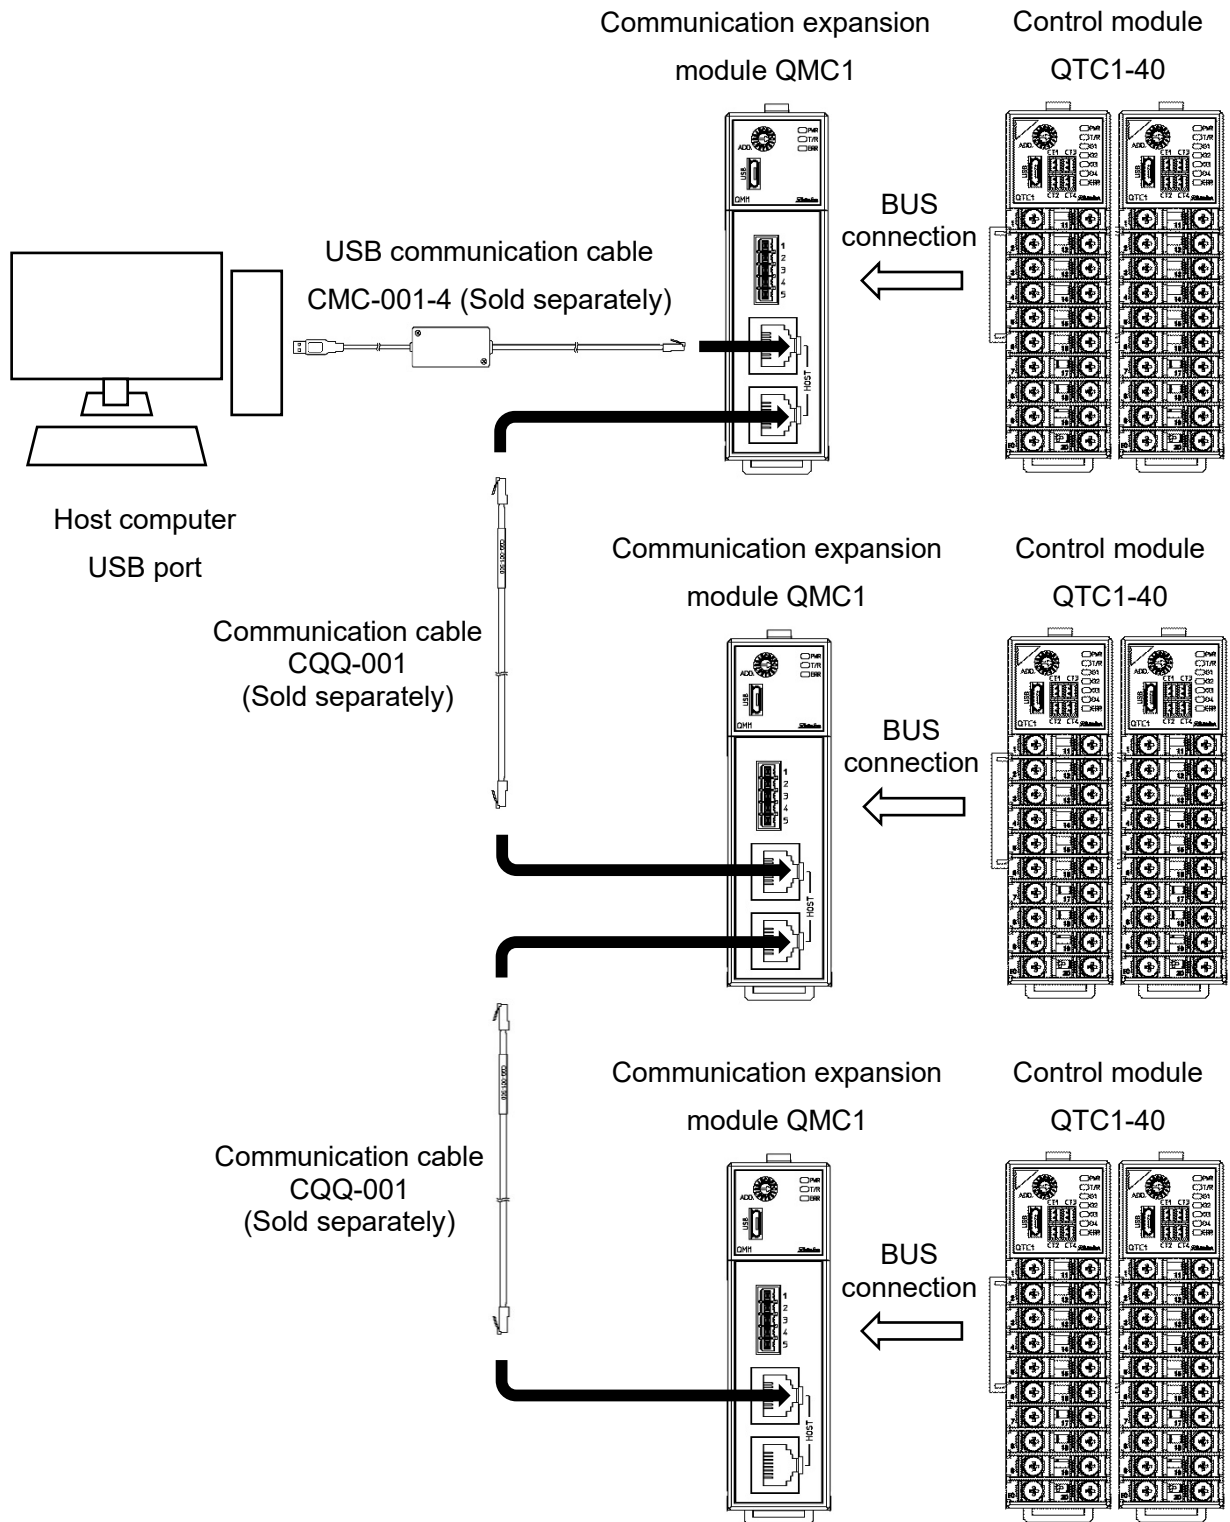

(Fig. 7.4.2-1)

8 Setting of Specification

Set the specifications.

This section describes how to set specifications using console software (SWC-QMC101M).

8.1 Preparation

8.1.1 Preparation of USB Communication Cable and Console Software

Please prepare the USB communication cable and the console software.

- USB communication cable

  USB-micro USB Type-B (commercial item)

- Console software (SWC-QMC101M)

  Please download from our website and install.

  Click https://shinko-technos.co.jp/e/ → Support/Download → Software

8.1.2 Connecting to Host Computer

⚠ Caution

Do not use the logging function of the console software when communicating by connecting a USB communication cable.

---

(1) Connect the micro USB Type-B side of the USB communication cable to the console communication connector of this instrument.

(2) Connect the USB plug of the USB communication cable to the USB port of the host computer.

Connection example of QMC1 and QTC1-40
(Fig. 8.1.2-1)

(3) Checking the COM port number

Follow the procedure below to check the COM port number.

① Right-click "Start" → Click "Device manager" from menu.

② When "USB Serial Port (COM3)" is displayed in "Port (COM and LPT)", the COM port is assigned to No. 3.

Check the COM port number, and then close "Device Manager".

③ Start the console software (SWC-QMC101M).
(Fig. 8.1.2-2)

④ When start the console software for the first time, the communication condition setting screen is displayed.

If the communication condition settings have been completed, proceed to 7.
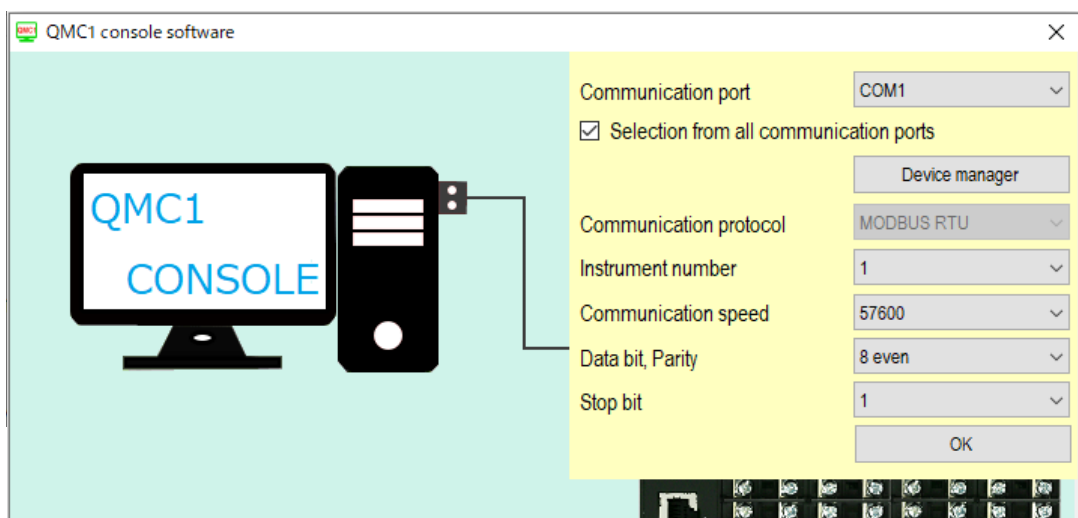

(Fig. 8.1.2-3)

⑤ Set the communication condition as shown below.

Setup Items	Setting Value
Communication port	Select the COM port number confirmed in ②.
Communication protocol	MODBUS RTU

⑥ Click [OK].

⑦ Display the Main screen.

(Fig. 8.1.2-4)

When QTC1-20 is connected, the data of CH3 and CH4 which cannot be set, are grayed out.

(Fig. 8.1.2-5)

The specifications are ready.

8.2 Specification Setting

Basic operation of specification setting

Before setting the specifications, how to select the selection item and how to set the setting item are explained.

Select the selection item

This section explains how to select the selection item by using "Control Allowed/Prohibited selection" as an example.

Click the selection item.
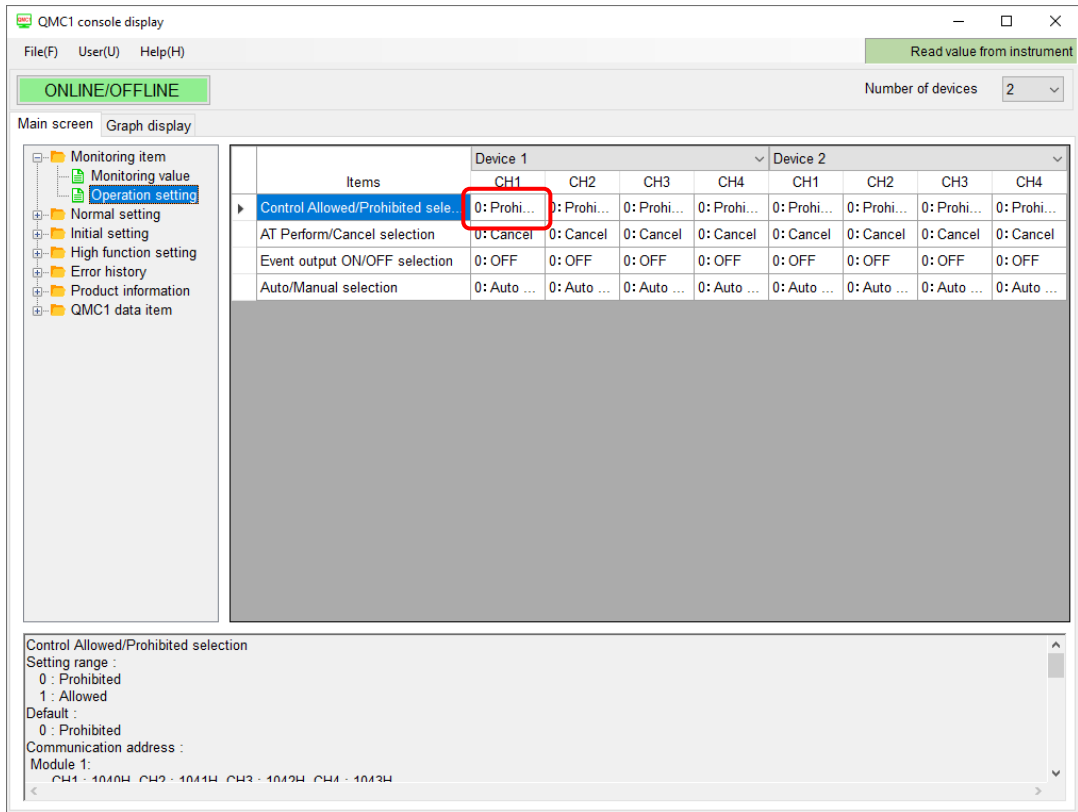

(Fig. 8.2-1)

Display the selection item list.

Click "0: Prohibited" or "1: Allowed".

Transfer the selected contents to this instrument.
(Fig. 8.2-2)

Set the setting item

This section explains how to set the setting item by using "Stting value (SV)" as an example.

Click on the setting value.
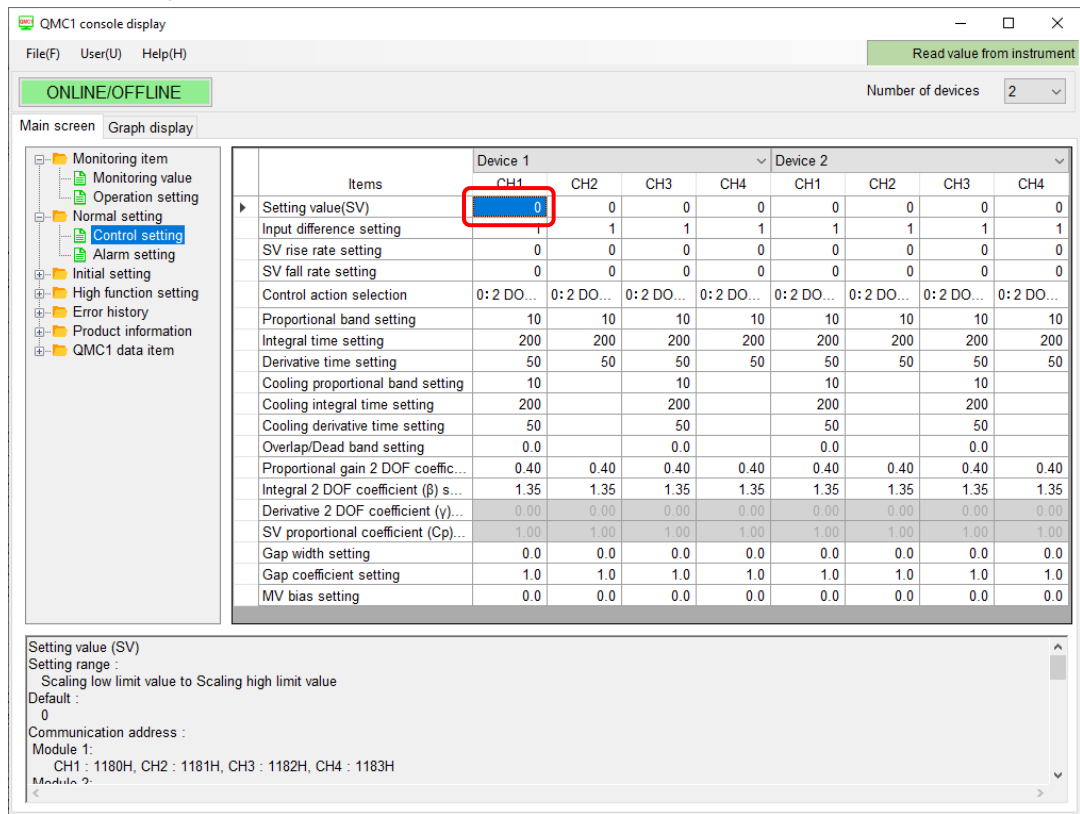

(Fig. 8.2-3)

Display the numeric keypad screen.

The current setting value and setting range are displayed on the numeric keypad screen.

Set within the setting range.

Input the setting value, and click [OK]. (*)

Transfer the setting value to this instrument.

(*): The setting value can also be entered from the keyboard of the host computer.
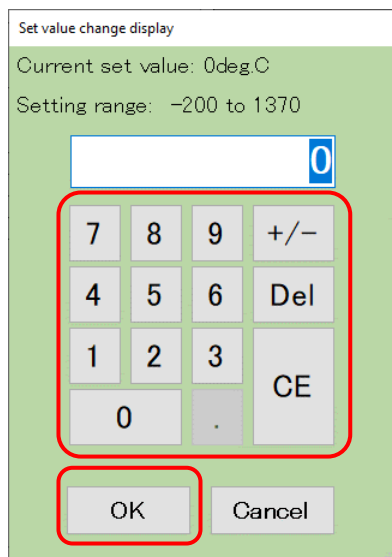

(Fig. 8.2-4)

8.2.1 Setting Items of through USB

Display the software version, manufacturing date, total energizing time, etc. of this instrument.

Host communication protocol, number of communication management modules and communication response delay time.

Click [Main screen] tab → [QMC1 data item] → [USB limited item].

Display the USB limited item screen.
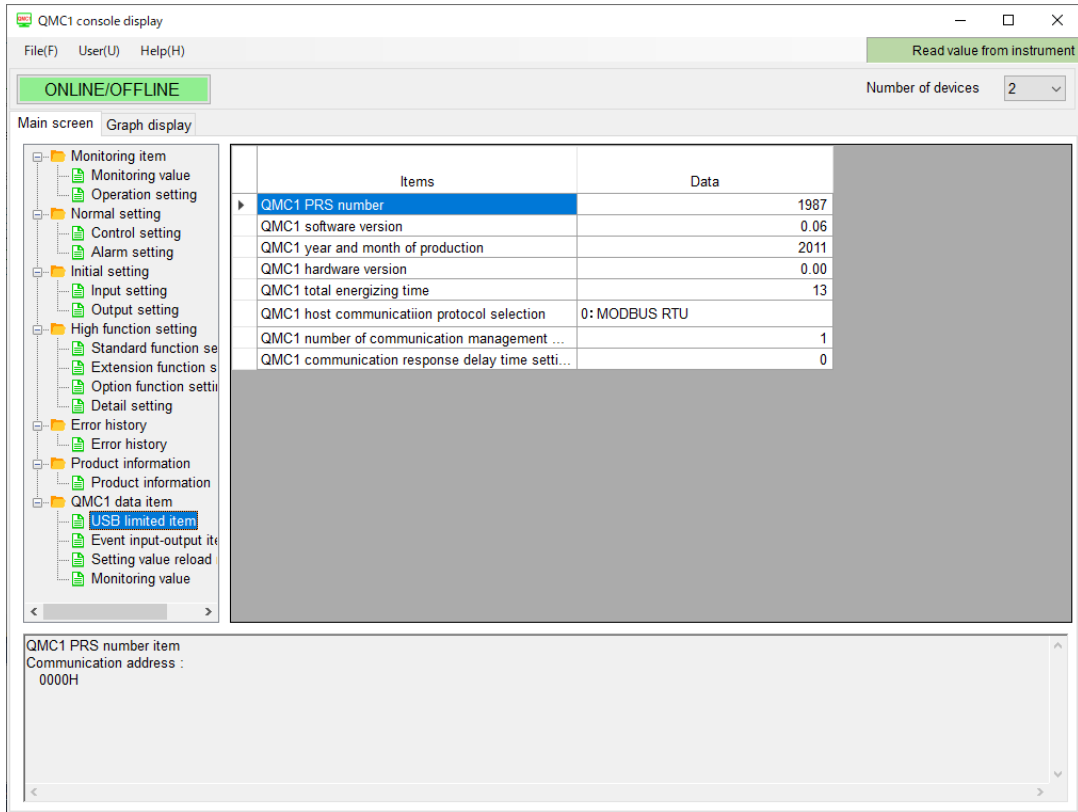

(Fig. 8.2.1-1)

Item	Description	Product information example
QMC1 PRS number	Reads the PRS number of this instrument.	1987: QMC1
QMC1 software version	Reads the software version of this instrument.	2: Ver. 0.02
QMC1 year and month of production	Reads the manufacturing date of this instrument.	2011: November 2020
QMC1 hardware version	Reads the hardware version of this instrument. Ver. 0.00: 0000H	0: Ver. 0.00
QMC1 total energizing time	Reads the total energizing time of this instrument. It can be used to check the product life of this instrument. 1 hour/1 count	48: 48 hours

Setting item	Description and setting range	Factory default
QMC1 host communication protocol selection	Select the host communication protocol of this instrument. Selection item: 0: MODBUS RTU 1: Made by Mitsubishi Electric Corporation D register QR/QW 2: Made by Mitsubishi Electric Corporation R register QR/QW 3: Made by Mitsubishi Electric Corporation D register WR/WW 4: Made by Mitsubishi Electric Corporation R register WR/WW 5: Made by OMRON Corporation DM register FINS command 6: Made by KEYENCE CORPORATION DM register RDS/WRS	0: MODBUS RTU
QMC1 number of communication management modules setting	Set the number of modules managed by this instrument. Setting range: 1 to 16 modules	1 module
QMC1 communication response delay time setting	Set the delay time for this instrument to return a response after receiving a command from the host. Setting range: 0 to 1000 ms [Additional Explanation] Set the communication response delay time of the connected QTC1-□0 to 0 ms.	0 ms

8.2.2 Setting Event Input / Output Items

Set the event input/output items such as event input allocation and event output allocation.

Click [Main screen] tab → [QMC1 data item] → [Event input-output item].

Display the Event input-output item screen.
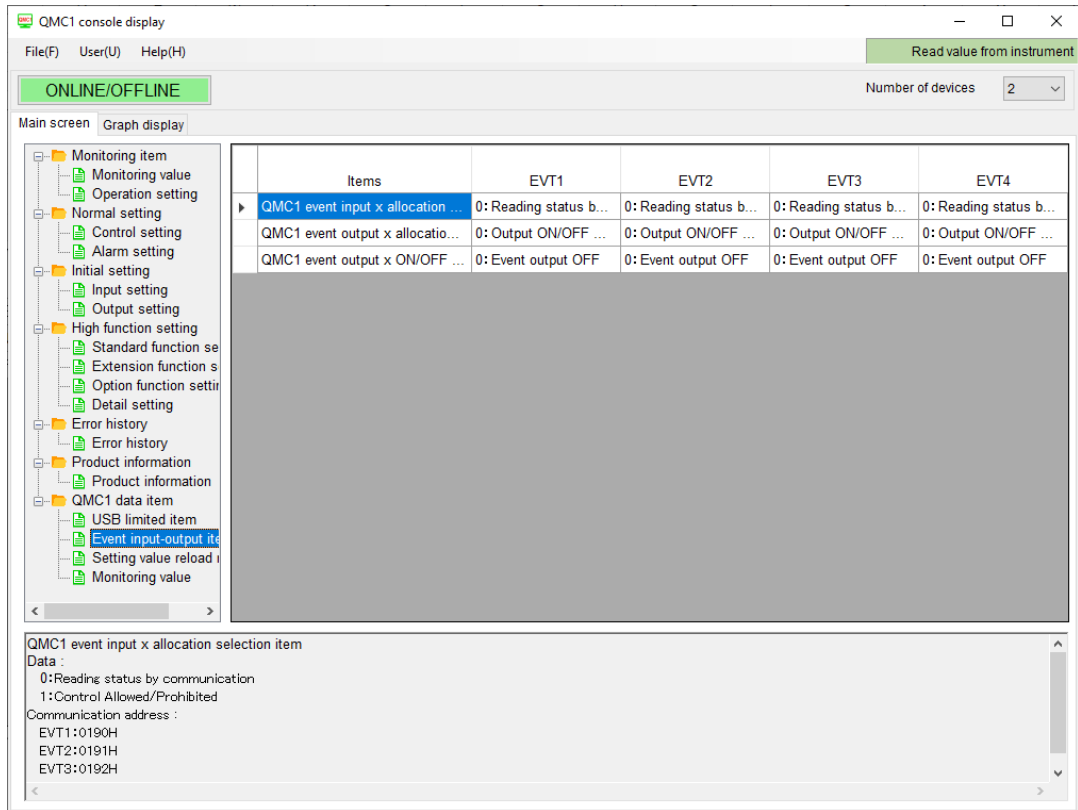

(Fig. 8.2.2-1)

Setting item	Description, setting range and selection item	Factory default
QMC1 Event input 1 allocation selection item	Select the event input 1 allocation of this instrument. Selection item: 0: Read status by communication It can be used for any operation by reading the event input 1 status flag. When event input 1 is turned OFF, 0 is set in the event input 1 status flag, and when event input 1 is turned ON, 1 is set in the event input 1 status flag. 1: Control Allowed/Prohibited Control is enabled when event input 1 is turned ON, and control is disabled when event input 1 is turned OFF for all connected QTC1-□0 channels. However, if control is enabled / disabled by the event input of QTC1-□0, the event input of QTC1-□0 has priority.	0: Read status by communication
QMC1 Event input 2 allocation selection item	Select the event input 2 allocation of this instrument. Selection item: 0: Read status by communication It can be used for any operation by reading the event input 2 status flag. When event input 2 is turned OFF, 0 is set in the event input 2 status flag, and when event input 2 is turned ON, 1 is set in the event input 2 status flag. 1: Control Allowed/Prohibited Control is enabled when event input 2 is turned ON, and control is disabled when event input 2 is turned OFF for all connected QTC1-□0 channels. However, if control is enabled / disabled by the event input of QTC1-□0, the event input of QTC1-□0 has priority.	0: Read status by communication

Setting item	Description, setting range and selection item	Factory default
QMC1 Event input 3 allocation selection item	Select the event input 3 allocation of this instrument. Selection item: 0: Read status by communication It can be used for any operation by reading the event input 3 status flag. When event input 3 is turned OFF, 0 is set in the event input 3 status flag, and when event input 3 is turned ON, 1 is set in the event input 3 status flag. 1: Control Allowed/Prohibited Control is enabled when event input 3 is turned ON, and control is disabled when event input 3 is turned OFF for all connected QTC1-□0 channels. However, if control is enabled / disabled by the event input of QTC1-□0, the event input of QTC1-□0 has priority.	0: Read status by communication
QMC1 Event input 4 allocation selection item	Select the event input 4 allocation of this instrument. Selection item: 0: Read status by communication It can be used for any operation by reading the event input 4 status flag. When event input 4 is turned OFF, 0 is set in the event input 4 status flag, and when event input 43 is turned ON, 1 is set in the event input 4 status flag. 1: Control Allowed/Prohibited Control is enabled when event input 4 is turned ON, and control is disabled when event input 4 is turned OFF for all connected QTC1-□0 channels. However, if control is enabled / disabled by the event input of QTC1-□0, the event input of QTC1-□0 has priority.	0: Read status by communication

Setting item	Description, setting range and selection item	Factory default
QMC1 Event output 1 allocation selection item	Select the event output 1 allocation of this instrument. Selection item: 0: Event output 1 ON / OFF specification by communication By selecting the event output 1 ON / OFF selection, it can output arbitrarily from the host. In the event output 1 ON/OFF selection, set 0 (event output OFF) to turn event output 1 OFF and set 1 (event output ON) to turn event output 1 ON. 1: Alarm 1 If alarm 1 on any of the connected QTC1-□0 is turned ON, event output 1 will be turned ON. 2: Alarm 2 If alarm 2 on any of the connected QTC1-□0 is turned ON, event output 1 will be turned ON. 3: Alarm 3 If alarm 3 on any of the connected QTC1-□0 is turned ON, event output 1 will be turned ON. 4: Alarm 4 If alarm 4 on any of the connected QTC1-□0 is turned ON, event output 1 will be turned ON. 5: Heater burnout alarm If heater burnout alarm on any of the connected QTC1-□0 is turned ON, event output 1 will be turned ON. 6: Loop break alarm If loop break alarm on any of the connected QTC1-□0 is turned ON, event output 1 will be turned ON.	0: Event output 1 ON / OFF specification by communication

Setting item	Description, setting range and selection item	Factory default
QMC1 Event output 2 allocation selection item	Select the event output 2 allocation of this instrument. Selection item: 0: Event output 2 ON / OFF specification by communication 　By selecting the event output 2 ON / OFF selection, it can output arbitrarily from the host. In the event output 2 ON/OFF selection, set 0 (event output OFF) to turn event output 2 OFF and set 1 (event output ON) to turn event output 2 ON. 1: Alarm 1 　If alarm 1 on any of the connected QTC1-□0 is turned ON, event output 2 will be turned ON. 2: Alarm 2 　If alarm 2 on any of the connected QTC1-□0 is turned ON, event output 2 will be turned ON. 3: Alarm 3 　If alarm 3 on any of the connected QTC1-□0 is turned ON, event output 2 will be turned ON. 4: Alarm 4 　If alarm 4 on any of the connected QTC1-□0 is turned ON, event output 2 will be turned ON. 5: Heater burnout alarm 　If heater burnout alarm on any of the connected QTC1-□0 is turned ON, event output 2 will be turned ON. 6: Loop break alarm 　If loop break alarm on any of the connected QTC1-□0 is turned ON, event output 2 will be turned ON.	0: Event output 2 ON / OFF specification by communication

Setting item	Description, setting range and selection item	Factory default
QMC1 Event output 3 allocation selection item	Select the event output 3 allocation of this instrument. Selection item: 0: Event output 3 ON / OFF specification by communication 　By selecting the event output 3 ON / OFF selection, it can output arbitrarily from the host. In the event output 3 ON/OFF selection, set 0 (event output OFF) to turn event output 3 OFF and set 1 (event output ON) to turn event output 3 ON. 1: Alarm 1 　If alarm 1 on any of the connected QTC1-☐0 is turned ON, event output 3 will be turned ON. 2: Alarm 2 　If alarm 2 on any of the connected QTC1-☐0 is turned ON, event output 3 will be turned ON. 3: Alarm 3 　If alarm 3 on any of the connected QTC1-☐0 is turned ON, event output 3 will be turned ON. 4: Alarm 4 　If alarm 4 on any of the connected QTC1-☐0 is turned ON, event output 3 will be turned ON. 5: Heater burnout alarm 　If heater burnout alarm on any of the connected QTC1-☐0 is turned ON, event output 3 will be turned ON. 6: Loop break alarm 　If loop break alarm on any of the connected QTC1-☐0 is turned ON, event output 3 will be turned ON.	0: Event output 3 ON / OFF specification by communication

Setting item	Description, setting range and selection item	Factory default
QMC1 Event output 4 allocation selection item	Select the event output 4 allocation of this instrument. Selection item: 0: Event output 4 ON / OFF specification by communication By selecting the event output 4 ON / OFF selection, it can output arbitrarily from the host. In the event output 4 ON/OFF selection, set 0 (event output OFF) to turn event output 4 OFF and set 1 (event output ON) to turn event output 4 ON. 1: Alarm 1 If alarm 1 on any of the connected QTC1-□0 is turned ON, event output 4 will be turned ON. 2: Alarm 2 If alarm 2 on any of the connected QTC1-□0 is turned ON, event output 4 will be turned ON. 3: Alarm 3 If alarm 3 on any of the connected QTC1-□0 is turned ON, event output 4 will be turned ON. 4: Alarm 4 If alarm 4 on any of the connected QTC1-□0 is turned ON, event output 4 will be turned ON. 5: Heater burnout alarm If heater burnout alarm on any of the connected QTC1-□0 is turned ON, event output 4 will be turned ON. 6: Loop break alarm If loop break alarm on any of the connected QTC1-□0 is turned ON, event output 4 will be turned ON.	0: Event output 4 ON / OFF specification by communication

Setting item	Description, setting range and selection item	Factory default
QMC1 Event output 1 ON/OFF selection	Select the event output 1 ON or OFF of this instrument from the host. Valid when 0 (event output 1 ON / OFF specification by communication) is selected by the event output 1 allocation selection. Selection item: 0: Event output 1 OFF 1: Event output 1 ON	0: Event output 1 OFF
QMC1 Event output 2 ON/OFF selection	Select the event output 2 ON or OFF of this instrument from the host. Valid when 0 (event output 2 ON / OFF specification by communication) is selected by the event output 2 allocation selection. Selection item: 0: Event output 2 OFF 1: Event output 2 ON	0: Event output 2 OFF
QMC1 Event output 3 ON/OFF selection	Select the event output 3 ON or OFF of this instrument from the host. Valid when 0 (event output 3 ON / OFF specification by communication) is selected by the event output 3 allocation selection. Selection item: 0: Event output 3 OFF 1: Event output 3 ON	0: Event output 3 OFF
QMC1 Event output 4 ON/OFF selection	Select the event output 4 ON or OFF of this instrument from the host. Valid when 0 (event output 4 ON / OFF specification by communication) is selected by the event output 4 allocation selection. Selection item: 0: Event output 4 OFF 1: Event output 4 ON	0: Event output 4 OFF

8.2.3 Selecting Setting Value Reload Request

Select a setting value reload request for the connected modules.

Click [Main screen] tab → [QMC1 data item] → [Setting value reload request].

Display the Setting value reload request screen.
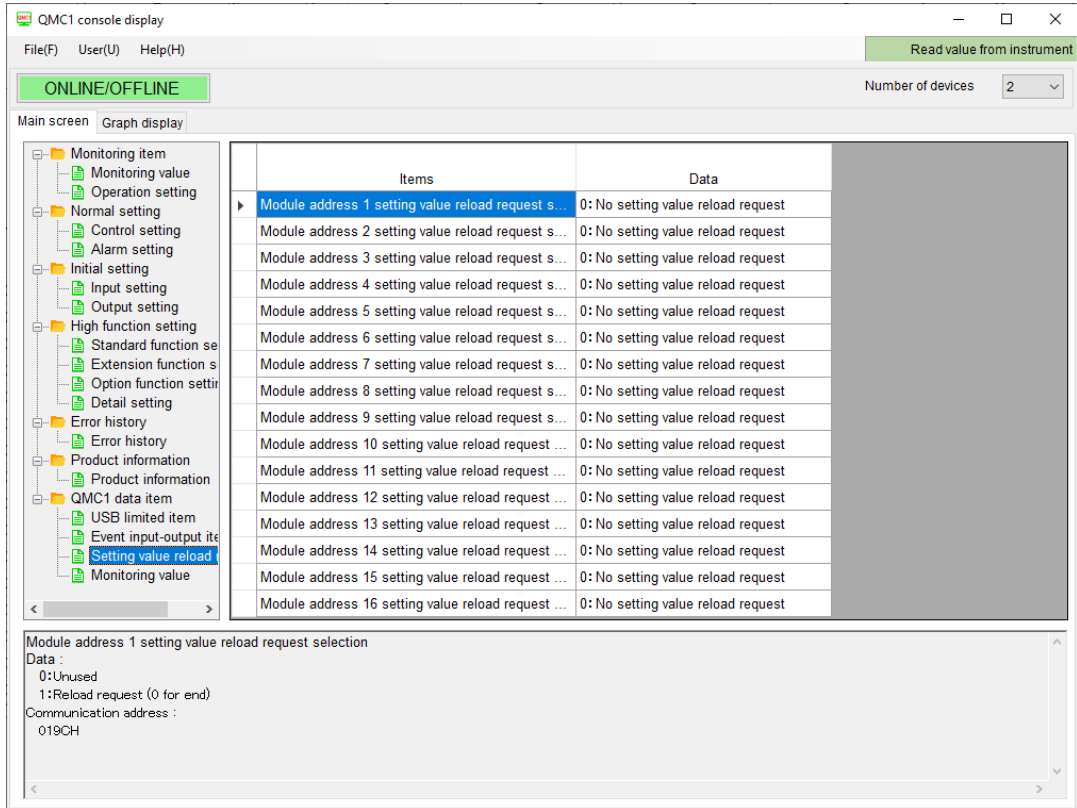

(Fig. 8.2.3-1)

Setting item	Description, setting range and selection item	Factory default
Module address 1 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 1. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 2 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 2. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 3 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 3. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 4 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 4. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 5 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 5. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 6 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 6. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 7 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 7. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request

(*): When the setting value reload finishes, it will be 0000H.

Setting item	Description, setting range and selection item	Factory default
Module address 8 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 8. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 9 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 9. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 10 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 10. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 11 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 11. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 12 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 12. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 13 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 13. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 14 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 14. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request

(*): When the setting value reload finishes, it will be 0000H.

Setting item	Description, setting range and selection item	Factory default
Module address 15 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 15. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request
Module address 16 Setting value reload request selection	Select either no setting value reload request or a setting value reload request for module address 16. Selection item: 0: No setting value reload request 1: Setting value reload request (*)	0: No setting value reload request

(*): When the setting value reload finishes, it will be 0000H.

8.2.4 Reading Monitor Values

Read a setting value reload request for the connected modules.

Reads the state flag, module recognition information and reload state flag of QMC1.

Click [Main screen] tab → [QMC1 data item] → [Monitoring value].

Display the Monitoring value screen.

(Fig. 8.2.4-1)

Data item	Data			
QMC1 Status flag	B0:	Event output 1	0: OFF	1: ON

	B15:	Module address 16	0: No setting value reload request 1: Reloading setting value

QMC1 power OFF $\rightarrow$ ON

    Turn the QMC1 power OFF $\rightarrow$ ON. The set value becomes effective.

9 Communication Procedure

Communication starts with command transmission from the host computer (hereafter Master), and ends with the response of this instrument (hereafter Slave).
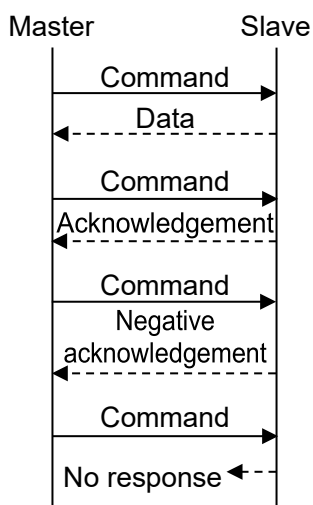

(Fig. 9-1)

- Response with data

  When the master sends the Read command, the slave responds with the corresponding set value or current status.

- Acknowledgement

  When the master sends the Write command, the slave responds by sending the acknowledgement after the processing is terminated.

- Negative acknowledgement

  When the master sends a non-existent command or value out of the setting range, the slave returns a negative acknowledgement.

- No response

  The slave will not respond to the master in the following cases:

  • Broadcast address is set.

  • Communication error (framing error, parity error)

  • CRC-16 discrepancy

Communication timing of the RS-485

  Master Side (Take note while programming)

    When the master starts transmission through the RS-485 communication line, the master is arranged so as to provide an idle status (mark status) transmission period of 1 or more characters before sending the command to ensure synchronization on the receiving side.

    Set the program so that the master can disconnect the transmitter from the communication line within a 1 character transmission period after sending the command in preparation for reception of the response from the slave.

    To avoid collision of transmissions between the master and the slave, send the next command after carefully checking that the master has received the response.

    If a response to the command is not returned due to communication errors, set the Retry Processing to send the command again. (It is recommended to execute Retry twice or more.)

  Slave Side

    When the slave starts transmission through the RS-485 communication line, the slave is arranged so as to provide an idle status (mark status) transmission period of 1 ms or more (*) before sending the response to ensure synchronization on the receiving side.

    The slave is arranged so as to disconnect the transmitter from the communication line within a 1 character transmission period after sending the response.

    (*): Can be set in "Response delay time (P.8-7)" within a range of 0 to 1000 ms.

10 MODBUS Protocol

10.1 Transmission Mode

It becomes the RTU mode, and 8-bit binary data in command is transmitted as it is.

Data format	Start bit:	1 bit
	Data bit:	8 bits
	Parity:	Even (Odd, No parity) (Selectable)
	Stop bit:	1 bit (2 bits) (Selectable)
Error detection:		CRC-16 (Cyclic Redundancy Check)

10.2 Data Communication Interval

1.5 character transmission times or less

(Communication speed 9600 bps, 19200 bps: 1.5 character transmission times,

Communication speed 38400 bps, 57600 bps: 750 µs)

To transmit continuously, an interval between characters which consist of one message, must be within 1.5 character transmission times.

If an interval lasts longer than 1.5 character transmission times, the PCA1 assumes that transmission from the master is finished, which results in a communication error, and will not return a response.

10.3 Message Configuration

Message is configured to start after idle time is processed for more than 3.5 character transmissions, and end after idle time is processed for more than 3.5 character transmissions.

(Communication speed 9600 bps, 19200 bps: 3.5 character transmission times,

Communication speed 38400 bps, 57600 bps: 1.75 ms)

The data part has a maximum of 252 bytes.

3.5 idle characters	Slave address	Function code	Data	Error check CRC-16	3.5 idle characters

(1) Slave Address

Slave address is an individual instrument number on the slave side, and is set within the range 1 to 16 (01H to 10H). The master identifies slaves by the slave address of the requested message.

The slave informs the master which slave is responding to the master by placing its own address in the response message.

Slave address 0 (00H, Broadcast address) can identify all the slaves connected. However, slaves do not respond.

(2) Function Code

The function code is the command code for the slave to undertake one of the following actions.

Type	Function Code	Sub Function Code	Contents
Data access	03(03H)		Reads a single or multiple piece(s) of data from slave(s) (Amount of data: Max. 100).
	06(06H)		Writes a single piece of data to slave(s).
	16(10H)		Writes multiple pieces of data to slave(s) (Amount of data: Max. 100).

The function code is used to discern whether the response is normal (acknowledgement) or if any

error (negative acknowledgement) has occurred when the slave returns the response message to the master.

When acknowledgement is returned, the slave simply returns the original function code.

When negative acknowledgement is returned, the MSB of the original function code is set as 1 for the response.

For example, if the master sends request message setting 13H to the function code by mistake, slave returns 93H by setting the MSB to 1, because the former is an illegal function.

For negative acknowledgement, the exception codes below are set to the data of the response message, and returned to the master in order to inform it of what kind of error has occurred.

Exception Code	Contents
1(01H)	Illegal function (Non-existent function)
2(02H)	Illegal data address (Non-existent data address)
3(03H)	Illegal data value (Value out of the setting range)
17(11H)	Status unable to be written. (AT is performing.)

(3) Data

Data differs depending on the function code.

A request message from the master is composed of a data item, amount of data and setting data.

A response message from the slave is composed of the byte count , data and exception codes in negative acknowledgements, corresponding to the request message.

The effective range of data is -32768 to 32767 (8000H to 7FFFH).

Refer to "11.1 Communication Command List (P.11-1 to P.11-87)".

(4) Error Check

After calculating CRC-16 (Cyclic Redundancy Check) from the slave address to the end of the data, the calculated 16-bit data is appended to the end of message in sequence from low order to high order.

[How to calculate CRC-16]

In the CRC-16 system, the information is divided by the polynomial series. The remainder is added to the end of the information and transmitted. The generation of a polynomial series is as follows.

(Generation of polynomial series: $X^{16} + X^{15} + X^2 + 1$)

① Initialize the CRC-16 data (assumed as X) (FFFFH).

② Calculate exclusive OR (XOR) with the 1st data and X. This is assumed as X.

③ Shift X one bit to the right. This is assumed as X.

④ When a carry is generated as a result of the shift, XOR is calculated by X of ③ and the fixed value (A001H). This is assumed as X. If a carry is not generated, go to step ⑤.

⑤ Repeat steps ③ and ④ until shifting 8 times.

⑥ XOR is calculated with the next data and X. This is assumed as X.

⑦ Repeat steps ③ to ⑤.

⑧ Repeat steps ③ to ⑤ up to the final data.

⑨ Set X as CRC-16 to the end of message in sequence from low order to high order.

10.4 Message Example

Numerals written below the command represent the number of characters.

(1) Read [Slave address 1, CH1 Control enable/disable (1040H)]

• A request message from the master

Idle 3.5 characters	Slave address (01H)	Function code (03H)	Data item (1040H)	Amount of data (0001H)	Error check CRC-16 (811EH)	Idle 3.5 characters
	1	1	2	2	2	

• Response message from the slave in normal status [When control disable (0000H)]

Idle 3.5 characters	Slave address (01H)	Function code (03H)	Response byte count (02H)	Data (0000H)	Error check CRC-16 (B844H)	Idle 3.5 characters
	1	1	1	2	2	

(2) Write [Slave address 1, CH1 Control enable/disable (1040H)]

• A request message from the master [When writing control enable (0001H)]

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1040H)	Data (0001H)	Error check CRC-16 (4D1EH)	Idle 3.5 characters
	1	1	2	2	2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1040H)	Data (0001H)	Error check CRC-16 (4D1EH)	Idle 3.5 characters
	1	1	2	2	2	

• Response message from the slave in exception (error) status (When a value out of the setting range is set)

The function code MSB is set to 1 for the response message in exception (error) status, and 86H is returned.

The exception code 03H (Value out of the setting range) is returned (error).

Idle 3.5 characters	Slave address (01H)	Function code (86H)	Exception code (03H)	Error check CRC-16 (0261H)	Idle 3.5 characters
	1	1	1	2	

(3) Read [Slave address 1, CH1 SV(1180H)]

• A request message from the master

Idle	Slave	Function	Data item	Amount of data	Error check	Idle
3.5	address	code			CRC-16	3.5
characters	(01H)	(03H)	(1180H)	(0001H)	(80DEH)	characters
	1	1	2	2	2	

• Response message from the slave in normal status [When SV 600 °C (0258H)]

Idle	Slave	Function	Response	Data	Error check	Idle
3.5	address	code	byte count		CRC-16	3.5
characters	(01H)	(03H)	(02H)	(0258H)	(B8DEH)	characters
	1	1	1	2	2	

• Response message from the slave in exception (error) status (When data item is incorrect)

The function code MSB is set to 1 for the response message in exception (error) status, and 83H is returned.

The exception code 02H (Non-existent data address) is returned (error).

Idle	Slave	Function	Exception code	Error check	Idle
3.5	address	code		CRC-16	3.5
characters	(01H)	(83H)	(02H)	(C0F1H)	characters
	1	1	1	2	

(4) Write [Slave address 1, CH1 SV to CH4 SV] (Writing multiple pieces of data)

The configuration of the data is as follows.

Amount of data : 4(0004H)

Byte count　　　: 8(08H)

Data　　　　　　: Data is converted to Hexadecimal.

	Data Item	Data	Data (Converted to Hexadecimal)
1180H	CH1 SV setting	600 °C	0258H
1181H	CH2 SV setting	600 °C	0258H
1182H	CH3 SV setting	600 °C	0258H
1183H	CH4 SV setting	600 °C	0258H

• A request message from the master (When writing the above data)

Idle	Slave	Function	Data item	Data
3.5	address	code		
characters	(01H)	(10H)	(1180H)	(00040802580258025802580258H)
	1	1	2	11

Error check	Idle
CRC-16	3.5
(70D7H)	characters
2	

10-4

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1180H)	Data (0004H)	Error check CRC-16 (C51EH)	Idle 3.5 characters
	1	1	2	2	2	

(5) Read [Slave address 1, CH1 SV to CH4 SV] (Reading multiple pieces of data)

• A request message from the master (When writing the above data)

Idle 3.5 characters	Slave address (01H)	Function code (03H)	Data item (1180H)	Amount of data (0004H)	Error check CRC-16 (40DDH)	Idle 3.5 characters
	1	1	2	2	2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (03H)	Response byte count (08H)	Data (0258025802580258H)	
	1	1	1	8	

	Error check CRC-16 (6D15H)	Idle 3.5 characters
	2	

The data the response message is as follows.

	Data Item	Data	Data (Converted to Hexadecimal)
1180H	CH1 SV setting	600 °C	0258H
1181H	CH2 SV setting	600 °C	0258H
1182H	CH3 SV setting	600 °C	0258H
1183H	CH4 SV setting	600 °C	0258H

11 Communication Command List

11.1 List of QMC1 Communication Commands (For Console Software)

This section explains each item of communication command.

- Data Item

  This is a setting item for the QMC1.
- Address [HEX (Hexadecimal)]

  This is an each channel address of the QMC1.
- Attribute

  R/W: Read and write (Host ←→ QMC1)

  RO: Read only (Host ←— QMC1)
- Data

  This is an explanation of the setting range and setting conditions for each data.

Data Item	Address (HEX)	Attribute	Data
QMC1 PRS Number	0000	RO	1987: QMC1
QMC1 Software version	0001	RO	2: Ver. 0.02
Reservation (*)	0002	RO	
QMC1 Manufacturing date	0003	RO	2011: November 2020
QMC1 Hardware version	0004	RO	0: Ver. 0.00
Reservation (*)	0005 to 000F		
QMC1 Total energizing time	0010	RO	1 hour / 1 count
QMC1 Host communication protocol selection	0011	R/W	0000H: MODBUS RTU 0001H: Made by Mitsubishi Electric Corporation D register QR/QW 0002H: Made by Mitsubishi Electric Corporation R register QR/QW 0003H: Made by Mitsubishi Electric Corporation D register WR/WW 0004H: Made by Mitsubishi Electric Corporation R register WR/WW 0005H: Made by OMRON Corporation DM register FINS command 0006H: Made by KEYENCE CORPORATION DM register RDS/WRS
QMC1 Number of communication management modules setting	0012	R/W	1 to 16 modules
QMC1 Communication response delay time setting	0013	R/W	0 to 1000 ms

(*):   A single or multiple data are read, the reserved item returns the initial value (0) in acknowledgment.
       When writing single or multiple, Acknowledgement is returned and the data is discarded.

Data Item	Address (HEX)	Attribute	Data
Reservation (*)	0014		
Not used (*2)	0015 to 0063		
Default setting of SIF function item	0064 to 0173		This is the initial setting item for PLC communication using the SIF function. Refer to "14. Communication with PLC Using SIF Function (P. 14-1)".
Not used (*2)	0174 to 018F		

(*1): A single or multiple data are read, the reserved item returns the initial value (0) in acknowledgment. When writing single or multiple, Acknowledgement is returned and the data is discarded.

(*2): The Not used item returns error code 02H (non-existent data address) with negative acceptance when reading single or multiple data or writing single or multiple data.

11.2 List of QMC1 Communication Commands (For Communication Program)

This section explains each item of communication command.

- Data Item

  This is a setting item for the QMC1.

- Address [HEX (Hexadecimal)]

  This is an each channel address of the QMC1.

- Attribute

  R/W: Read and write (Host ◄─► QMC1)

  RO: Read only (Host ◄─ QMC1)

- Data

  This is an explanation of the setting range and setting conditions for each data.

Data Item	Address (HEX)	Attribute	Data
QMC1 Event input 1 Allocation selection	0190	R/W	0000H: State readout by communication 0001H: Control enable/disable
QMC1 Event input 2 Allocation selection	0191	R/W	
QMC1 Event input 3 Allocation selection	0192	R/W	
QMC1 Event input 4 Allocation selection	0193	R/W	
QMC1 Event output 1 Allocation selection	0194	R/W	0000H: ON/OFF of event output 1 is specified by communication 0001H: Alarm 1 0002H: Alarm 2 0003H: Alarm 3 0004H: Alarm 4 0005H: Heater burnout alarm 0006H: Loop error alarm
QMC1 Event output 2 Allocation selection	0195	R/W	0000H: ON/OFF of event output 2 is specified by communication 0001H: Alarm 1 0002H: Alarm 2 0003H: Alarm 3 0004H: Alarm 4 0005H: Heater burnout alarm 0006H: Loop error alarm
QMC1 Event output 3 Allocation selection	0196	R/W	0000H: ON/OFF of event output 3 is specified by communication 0001H: Alarm 1 0002H: Alarm 2 0003H: Alarm 3 0004H: Alarm 4 0005H: Heater burnout alarm 0006H: Loop error alarm

Data Item	Address (HEX)	Attribute	Data	
QMC1 Event output 4 Allocation selection	0197	R/W	0000H:	ON/OFF of event output 4 is specified by communication
			0001H:	Alarm 1

11.3 List of Communication Commands for Modules Connected to QMC1

> ### ⚠ Caution
>
> QMC1 does not check the setting range of the connected modules.
> Perform the setting range restriction on the host side.
> When QTC1-20 is connected, CH3 and CH4 of the setting items other than the heater burnout alarm setting do not work even if they are set..

This section explains each item of communication command, using the case of connecting QTC1-40 as an example.

- Data Item
  This is a setting item for QTC1-40.
- Module
  This is a module address of QTC1-40.
- Channel
  This is a channel number of QTC1-40.
- Address [HEX (Hexadecimal), DEC (Decimal)]
  This is an each channel address of QTC1-40.
- Attribute
  R/W: Read and write (Host ←→ QMC1 ←→ QTC1-40)
  RO: Read only (Host ←— QMC1 ←→ QTC1-40)
- Data
  This is an explanation of the setting range and setting conditions for each data.

Data Item	Address (HEX)					Attribute	Data
System	Channel					RO	**This is a system item for internal processing.** **Please do not use.**

High/Low limits range alarm	0 to Input span (*1)
Process high alarm	Input range low limit to Input range high limit (*2)
Process low alarm	Input range low limit to Input range high limit (*2)
High limit with standby	-(Input span) to Input span (*1)
Low limit with standby	-(Input span) to Input span (*1)
High/Low limits alarm with standby	0 to Input span (*1)
High/Low limits alarm individually	0 to Input span (*1)
High/Low limits range alarm individually	0 to Input span (*1)
High/Low limits alarm with standby individually	0 to Input span (*1)

(*1): For DC voltage, current input, the input span is the same as the scaling span.

(*2) For DC voltage, current input, input range low (or high) limit value is the same as scaling low (or high) limit value.

Event output allocation selection	Channel					R/W	0000H: No action Any value can be output by setting a value in the event output status flag from the host. Setting the event output status flag to 0 turns off the event output, and setting it to 1 turns on the event output. 0001H: Event output (CH alone) The event output turns ON when any of the selected channel's alarm, heater burnout alarm, or loop error alarm is activated. 0002H: Event output (CH interlock) The event output turns on when an alarm, heater burnout alarm, or loop error alarm occurs on all channels.

Ambient temperature reading	Channel					RO	Read the input terminal temperature of each channel. When thermocouple input, convert it to a value according to temperature unit selection. For the read value, the value of the first decimal place is returned regardless of the presence or absence of a decimal point in the input range. (Example) If 0.0 °C (32.0 °F), the read value will be 0 (320). When RTD input, DC current input, and DC voltage input, 0 is returned.

Reservation (*)	FA80 to FFFF						

(*): A single or multiple data are read, the reserved item returns the initial value (0) in acknowledgment. When writing single or multiple, Acknowledgement is returned and the data is discarded.

11.4 Data

11.4.1 Notes About Write/Read Command

- The data (set value, decimal) is converted to a hexadecimal number.

  Negative numbers are represented in 2's complement.

- Do not use undefined Data items. If they are used, negative acknowledgement will be returned or a random value will be written or read, resulting in malfunction.

- MODBUS protocol uses Holding Register addresses. The Holding Register addresses are created as follows.

  A data item is converted to decimal number, and the offset of 40001 is added. The result is the Holding Register address.

  (Example)   When using the module 1 CH1 SV (1140H), the data item in the sending message is 1140H, however, MODBUS protocol Holding Register address is 44417(4416+40001).

11.4.2 Write Command

- The lifetime of the non-volatile IC memory is about 10 trillion writes.

  Do not change the set value frequently by communication, as the set value storage retention time may be shortened if the number of times is exceeded. (If the set value is the same as the value before setting, it is not written to the non-volatile IC memory.)

- When data (set value) has a decimal point, a whole number (hexadecimal) without a decimal point is used.

- If the operation is changed with Alarm 1 action to Alarm 4 action (1380H to 147FH), Alarm 1 value to Alarm 4 value (1580H to 177FH) will return to the factory default values.

  For the items to be initialized, refer to "11.7 Initialization Items by Changing Settings (P.11-90)".

- Even if options are not ordered, writing via software communication will be possible. However, their command contents will not function.

- Communication parameters such as module address and communication speed of this instrument cannot be written by software communication. Set it with the rotary switch for module address selection and the dip switch for selecting communication specifications.

- When Write is executed using the Broadcast address [(00H) MODBUS protocol] command, the command is sent to all the connected slaves. However, a response is not returned.

11.4.3 Read Command

- When the data (set value) has a decimal point, a whole number (hexadecimal) without a decimal point is used for a response.

11.5 Negative Acknowledgement

11.5.1 Error Code 2 (02H)

The slave will return Error code 2 (02H) in the following case.

 • When non-existent data item is read or written.

11.5.2 Error Code 3(03H)

The slave will return Error code 3 (03H) in the following case.

 • When a value out of the setting range is written.

11.5.3 Error Code 17(11H)

The slave will return Error code 17 (11H) in the following case.

 • When AT execution (0001H) is written with AT execution/stop selection (1080H to 10BFH) during PI operation or ON/OFF operation.

 • When AT execution (0001H) is written with AT execution/stop selection (1080H to 10BFH) during AT execution.

   When the control enable/disable selection (1040H to 107FH) is written during AT execution.

 • When manual control MV setting (1140H to 117FH) is written during automatic control.

11.6 Notes on Programming Monitoring Software

11.6.1 How to Speed up the Scan Time

When monitoring multiple this instrument, set the program so that the requisite minimum pieces of data such as PV (6000H to 603FH), MV (6040H to 607FH), Status flag 1 (60C0H to 60FFH) can be read. For other data, set the program so that they can be read only when their set value has changed. This will speed up the scan time.

11.6.2 How to Read PID Parameters after AT or Start-up AT Finishes

While AT or Start-up AT is performing, this instrument sets "B1: AT Perform/Cancel" of "Status flag 1 (60C0H to 60FFH)" to "1: AT Perform".

After AT or Start-up AT is finished, PID parameters are updated.

On the monitoring software side, check that "B1: AT Perform/Cancel" of "Status flag 1 (60C0H to 60FFH)" has been set to "0: AT Cancel", then read parameters such as P, I, D.

11.6.3 Notes on Batch Transmission of All Setting Values

 • If the operation is changed with Alarm 1 action to Alarm 4 action (1380H to 147FH), Alarm 1 value to Alarm 4 value (1580H to 177FH) will return to the factory default values.
   Send the Alarm action and then the Alarm value.
   For the items to be initialized, refer to "11.7 Initialization Items by Changing Settings (P.11-90)".

 • If the input type is changed with Input type (2000H to 203FH), the setting values such as SV, Proportional band, and Alarm 1 value are initialized.
   Send the Input type and then the other setting values.
   For the items to be initialized, refer to "11.7 Initialization Items by Changing Settings (P.11-90)".

11.7 Initialization Items by Changing Settings

The items that are initialized by changing the settings are shown below.

○: Initialize

一: Not initialize

Initialized item \ Setting change item	Input type (2000H to 203FH)	Temperature unit (2040H to 207FH)	Alarm 1 action (1380H to 13BFH)	Alarm 2 action (13C0H to 13FFH)	Alarm 3 action (1400H to 143FH)	Alarm 4 action (1440H to 147FH)
SV(1180H to 11BFH)	○	○	一	一	一	一
Proportional band (11C0H to 11FFH)	○	○	一	一	一	一
ON/OFF hysteresis (12C0H to 12FFH)	○	○	一	一	一	一
Alarm 1 hysteresis (1480H to 14BFH)	○	○	○	一	一	一
Alarm 2 hysteresis (14C0H to 14FFH)	○	○	一	○	一	一
Alarm 3 hysteresis (1500H to 153FH)	○	○	一	一	○	一
Alarm 4 hysteresis (1540H to 157FH)	○	○	一	一	一	○
Alarm 1 value (1580H to 15BFH)	○	○	○	一	一	一
Alarm 1 high limit value (15C0H to 15FFH)	○	○	○	一	一	一
Alarm 2 value (1600H to 163FH)	○	○	一	○	一	一
Alarm 2 high limit value (1640H to 167FH)	○	○	一	○	一	一
Alarm 3 value (1680H to 16BFH)	○	○	一	一	○	一
Alarm 3 high limit value (16C0H to 16FFH)	○	○	一	一	○	一
Alarm 4 value (1700H to 173FH)	○	○	一	一	一	○
Alarm 4 high limit value (1740H to 177FH)	○	○	一	一	一	○
Loop break alarm band (17C0H to 17FFH)	○	○	一	一	一	一
Loop break alarm time (1800H to 183FH)	○	○	一	一	一	一
Sensor correction factor (1840H to 187FH)	○	○	一	一	一	一
Sensor correction (1880H to 18BFH)	○	○	一	一	一	一
SV rise rate (1900H to 193FH)	○	○	一	一	一	一
SV drop rate (1940H to 197FH)	○	○	一	一	一	一
Scaling high limit (2080H to 20BFH)	○	○	一	一	一	一
Scaling low limit (20C0H to 20FFH)	○	○	一	一	一	一
AT bias (21C0H to 21FFH)	○	○	一	一	一	一
Input difference detection setting (3080H to 30BFH)	○	○	一	一	一	一
Cooling P-band (4040H to 407FH)	○	○	一	一	一	一
Slave scale high limit (4280H to 42BFH)	○	○	一	一	一	一
Slave scale low limit (42C0H to 42FFH)	○	○	一	一	一	一
Auto balance control cancel area (5240H to 527FH)	○	○	一	一	一	一

12　Operation

This section describes the operation when operating by communicating with the host computer.

Refer to "11 Communication Command List (P.11-1 to P.11-87)" for setting the control parameters such as SV and alarm required for operation.

12.1 Control Permission

(1)　Before turning the power ON

Check the following contents before turning the power ON to this instrument.

- Preparation of communication program

  A communication program is required to connect and use the host computer.

  Refer to "10 MODBUS Protocol (P.10-1 to P.10-5)" to create the communication program.

- Select communication specifications

  Select the communication specifications such as communication speed, data bit, and parity.

  Refer to "5.1 Selection of Communication Specifications (P.5-1, P.5-2)".

- Select module address

  Select the module address.

  Refer to "5.2 Selection of Module Address (P.5-3)".

- Mounting

  Mount this instrument to the DIN rail.

  Refer to "6.3 Mounting (P.6-3)".

- Wiring

  Wire this instrument.

  Refer to "7.3 Wiring (P.7-5 to P.7-7)".

- Connection of the QMC1 and QTC1-40 to the host computer

  Connect the QMC1 and QTC1-40 to the host computer.

  Refer to "7.4 Connection of QMC1 and QTC1-40 to Host Computer (P.7-8, P.7-9)".

(2)　After turning the power ON

Check the following contents after turning the power ON to this instrument.

- Specification setting

  Set the specifications of through USB items and event input/output items.

  Refer to "8.2 Specification Setting (P.8-4 to P.8-19)".

- Control parameters setting

  Set the control parameters of QTC1-40 such as SV and alarm.

  Refer to "11 Communication Command List (P.11-1 to P.11-87)".

(3)　Turn OFF → ON the power of QMC1 and OTC1-□0

Turn OFF → ON the power of QMC1 and QTC1-□0. The set value becomes effective.

(4)　Turn ON the load circuit power

(5) Permission of control

Select "Control enabled" in "Control enable/disable".

The control operation starts so that the controlled object keeps CH1 SV.

Control enabled [Slave address 1, Control enable/disable of CH1] (Single data writing)

• Request message from the master

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1040H)	Data (0001H)	Error check CRC-16 (4D1EH)	Idle 3.5 characters
	1	1	2	2	2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1040H)	Data (0001H)	Error check CRC-16 (4D1EH)	Idle 3.5 characters
	1	1	2	2	2	

Selecting control enable for slave address 1, CH1 control enable/disable (1040H) to slave address 5, CH4 control enable/disable (1053H) (multiple data writing for 20 commands)

Amount of data : 20 (0014H)

Byte count   : 40 (28H)

Data   : Control enable (0001H)

• Request message from the master (When writing the above data)

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1040H)	Data (001428000100010001...0001H)	
	1	1	2	43	

Error check CRC-16 (F16EH)	Idle 3.5 characters
2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1040H)	Data (0014H)	Error check CRC-16 (C512H)	Idle 3.5 characters
	1	1	2	2	2	

12.2 Set PID Constants (Execute AT)

> ⚠ **Caution**
>
> - Perform the AT during the trial run.
> - During AT, the all setting items can not be set.
> - If a power failure occurs during AT execution, AT will be stopped.
> - If AT is cancelled during the process, each setting values of P, I, D will revert to the values before AT was performed.
> - If AT does not end about 4 hours after starting AT, AT is automatically stopped.
> - If AT is executed near normal temperature, the temperature may not change and AT may not end normally.
> - When AT is executed under Gap-PID control, D is calculated in 0 seconds.

Execute AT to set the PID constant.

There are two types of AT for this instrument, Normal AT and Start-up AT.

Refer to "AT action (00E0H to 00E3H) (P.11-33)" for AT action selection.

To perform AT, refer "AT Perform/Cancel selection (1080H to 10BFH) (P.11-11)" and select AT Perform.

AT perform [Slave address 1, AT Perform/Cancel selection of CH1] (Single data writing)

- Request message from the master

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1080H)	Data (0001H)	Error check CRC-16 (4D22H)	Idle 3.5 characters
	1	1	2	2	2	

- Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1080H)	Data (0001H)	Error check CRC-16 (4D22H)	Idle 3.5 characters
	1	1	2	2	2	

AT perform [Slave address 1, AT Perform/Cancel selection of CH1] to [Slave address 5, AT Perform/Cancel selection of CH4] (Multiple data writing for 20 commands)

  Amount of data : 20 (0014H)

  Byte count   : 40 (28H)

  Data   : AT perform (0001H)

• Request message from the master

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1080H)	Data (001428000100010001...0001H)	
	1	1	2	43	

	Error check CRC-16 (61FEH)	Idle 3.5 characters
	2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1080H)	Data (0014H)	Error check CRC-16 (C52EH)	Idle 3.5 characters
	1	1	2	2	2	

While AT is running, set "AT perform (1)" in B1: AT perform/cancel of status flag 1 (60C0H to 60FFH). At the end of AT, set "AT cancel (0)" in B1: AT perform/cancel of status flag 1 (60C0H to 60FFH) and takes control with the PID constant set by AT.

If the AT does not end after about 4 hours after the start of AT, the AT is automatically canceled.

12.3 Set Alarm

For Alarm output, the alarm value is set by deviation from the SV (excluding Process alarm), and if the PV goes outside the range, the Alarm output is turned ON (turned OFF for High/Low limit range alarm).

It can select from High limit alarm, Low limit alarm, High/Low limits alarm, High/Low limit range alarm, Process high alarm, Process low alarm, High limit with standby alarm, Low limit with standby alarm, High/Low limits with standby alarm, High/Low limits alarm individually, High/Low limit range alarm individually, High/Low limits with standby alarm individually or no operation.
Refer to the control module QTC1-☐ instruction manual "14.5.3 Alarm Action (14-31)" for detail of alarm action.

Alarm settings are made using Alarm action and Alarm value.
If the operation is changed with Alarm 1 action to Alarm 4 action (1380H to 147FH), Alarm 1 value to Alarm 4 value (1580H to 177FH) will return to the factory default values.
Send the Alarm action and then the Alarm value.

This section describes the CH1 alarm 1 setting example and alarm operation.

[Setting example]

Setting item	Setting value
SV	600 °C
Alarm 1 action	High limit alarm
Alarm 1 value	20 °C
Alarm 1 hysteresis	1.0 °C

[Alarm action]
When PV will be more than 620 °C, Alarm 1 output turns ON.
When PV will be less than 619 °C, Alarm 1 output turns OFF.
(Fig. 12.3-1)

High limit alarm [Slave address 1, Alarm 1 action of CH1] (Single data writing)

- A request message from the master

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1380H)	Data (0001H)	Error check CRC-16 (4D66H)	Idle 3.5 characters
	1	1	2	2	2	

- Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1380H)	Data (0001H)	Error check CRC-16 (4D66H)	Idle 3.5 characters
	1	1	2	2	2	

20 °C (0014H) [Slave address 1, Alarm 1 value of CH1] (Single data writing)

- A request message from the master

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1580H)	Data (0014H)	Error check CRC-16 (8C21H)	Idle 3.5 characters
	1	1	2	2	2	

- Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (06H)	Data item (1580H)	Data (0014H)	Error check CRC-16 (8C21H)	Idle 3.5 characters
	1	1	2	2	2	

High limit alarm [Slave address 1, Alarm 1 action (1380H) of CH1] to [Slave address 5, Alarm 1 action (1393H) of CH4] (Multiple data writing for 20 commands)

  Amount of data : 20 (0014H)

  Byte count   : 40 (28H)

  Data   : High limit alarm (0001H)

• Request message from the master (When writing the above data)

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1380H)	Data (001428000100010001...0001H)
	1	1	2	43

Error check CRC-16 (D20FH)	Idle 3.5 characters
2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1380H)	Data (0014H)	Error check CRC-16 (C56AH)	Idle 3.5 characters
	1	1	2	2	2	

20 °C (0014H) [Slave address 1, Alarm 1 value (1580H) of CH1] to [Slave address 5, Alarm 1 value (1593H) of CH4] (Multiple data writing for 20 commands)

  Amount of data : 20 (0014H)

  Byte count   : 40 (28H)

  Data   : 20 °C (0014H)

• Request message from the master (When writing the above data)

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1580H)	Data (001428001400140014...0014H)
	1	1	2	43

Error check CRC-16 (F369H)	Idle 3.5 characters
2	

• Response message from the slave in normal status

Idle 3.5 characters	Slave address (01H)	Function code (10H)	Data item (1580H)	Data (0014H)	Error check CRC-16 (C5E2H)	Idle 3.5 characters
	1	1	2	2	2	

13 C Series Compatible Protocol

When using the C series compatible protocol, up to 5 modules (QTC1-20 or QTC1-40) can be connected to one unit.

The maximum number of data is 20 data.

Even when QTC1-20 is connected, it is recognized as 4 channels. However, CH3 and CH4 do not function.

For five QTC1-40 modules connected, the channel numbers of the C series for each module's channel number are as follows.

QTC1-40 - C series channel number table

QTC1-40			C series	
Module address 0	CH1	Device number 1	CH1	Data 1
	CH2		CH2	Data 2
	CH3	Device number 2	CH1	Data 3
	CH4		CH2	Data 4
Module address 1	CH1	Device number 3	CH1	Data 5
	CH2		CH2	Data 6
	CH3	Device number 4	CH1	Data 7
	CH4		CH2	Data 8
Module address 2	CH1	Device number 5	CH1	Data 9
	CH2		CH2	Data 10
	CH3	Device number 6	CH1	Data 11
	CH4		CH2	Data 12
Module address 3	CH1	Device number 7	CH1	Data 13
	CH2		CH2	Data 14
	CH3	Device number 8	CH1	Data 15
	CH4		CH2	Data 16
Module address 4	CH1	Device number 9	CH1	Data 17
	CH2		CH2	Data 18
	CH3	Device number 10	CH1	Data 19
	CH4		CH2	Data 20

13.1 Communication Procedure

Communication starts with command transmission from the host computer (Master), and ends with the response of this instrument (Slave).

When the master sends the Read command, the slave responds with the corresponding set value or current status.

When the master sends the Write command, the slave responds by sending the acknowledgement after the processing is terminated.

When the master sends a non-existent command or value out of the setting range, the slave returns a negative acknowledgement.

If a framing error or checksum error is detected, it does not return a response.

13.2 Data Configuration

The commands are all configured in ASCII code.

Numerals written below the command represent the number of characters.

The data (setting value) converts a decimal number to a hexadecimal number.

Negative numbers are represented by the 2's complement.

(1) Setting commands

Header (02H)	Address	Subaddress (20H)	Command type (52H)	Data item
1	1	1	1	4

Data 1	Data 2		Data 20	Checksum	Delimiter (03H)
4	4		4	2	1

20 words (for 5 modules)
(2) Read command

Header (02H)	Address	Subaddress (20H)	Command type (22H)	Data item	Checksum	Delimiter (03H)
1	1	1	1	4	2	1

(3) Response with data

Header (06H)	Address	Subaddress (20H)	Command type (22H)	Data item
1	1	1	1	4

Data 1	Data 2		Data 20	Checksum	Delimiter (03H)
4	4		4	2	1

20 words (for 5 modules)
(4) Acknowledgement

Header (06H)	Address	Checksum	Delimiter (03H)
1	1	2	1

(5) Negative acknowledgement

Header (15H)	Address	Error code	Checksum	Delimiter (03H)
1	1	1	2	1

Header : Control code for the command or the beginning of the response, using ASCII code.
STX (02H) is fixed for setting command and read command.
ACK (06H) is fixed for response with data and acknowledgement.
NAK (15H) is fixed for negative acknowledgement.

Address : A number for the master to identify each slave.
Use the ASCII code (20H to 2FH), which is the module address 0 to 15 (00H to 0FH) plus 20H.

Subaddress : 20H is fixed.

Command type: This is a code for identifying the reading and setting.

Command type	Content	Description
22H	Reading block data (multiple data)	Reads for multiple consecutive data.
52H	Setting block data (multiple data)	Sets up for multiple consecutive data.

Data item : The data classification to be targeted by the command.
The 4-digit hexadecimal number is represented by ASCII code.
Refer to "13.4. Communication Command List (P.13-6 to P.13-10)".

Data : For read commands, there is no data section.
The contents of the data (setting value) vary depending on the setting command.
The 4-digit hexadecimal number is represented by ASCII code.
Set 20 words (for 5 modules) from data 1 to data 20.
If the number of data is 16 (four QTC1-40 units connected), set 0 for data 17 to 20.
Refer to "13.4. Communication Command List (P.13-6 to P.13-10)".

Checksum : Two characters of data for communication error detection.

Delimiter : The control code that represents the end of the command, and is fixed to ASCII code ETX (03H).

Error code : It is the type of error, the following numbers are represented by ASCII code.

Error code	Content
0(30H)	Unexplained error
1(31H)	For non-existent command
2(32H)	Not used
3(33H)	Value outside the setting range
4(34H)	For non-configurable conditions (during warm-up when the power is turned on)

(*): If data outside the setting range is included in the setting, it returns the negative acknowledgement with error code 3 (33H). However, data within the setting range will be set as valid data.

How to calculate the checksum

Checksum is used to detect receiving errors in the command or data.

Set the program for the master side as well to calculate the checksum of the response data from the slaves so that the communication errors can be checked.

The ASCII code (hexadecimal) corresponding to the characters which range from the address to that before the checksum is converted to binary notation, and the total value is calculated.

The lower one byte of the total value is converted to 2's complement, and then to hexadecimal numbers, that is, ASCII code for the checksum.

●Checksum calculation example

Calculation example when SV of Data 1 to Data 20 is set to 600 °C (0258H)

Address (module address): 0 (20H)

• 1's complement: Reverse each binary bit. 0 will become 1 and vice versa.
• 2's complement: Add 1 to 1's complement.

[e.g.]

Checksum calculation range

STX			R	0	0	0	1	0	2	5	8	···	0	2	5	8

[Represent send commands in ASCII code (hexadecimal)]

02	20	20	52	30	30	30	31	30	32	35	38	···	30	32	35	38

Data 1   Data 20
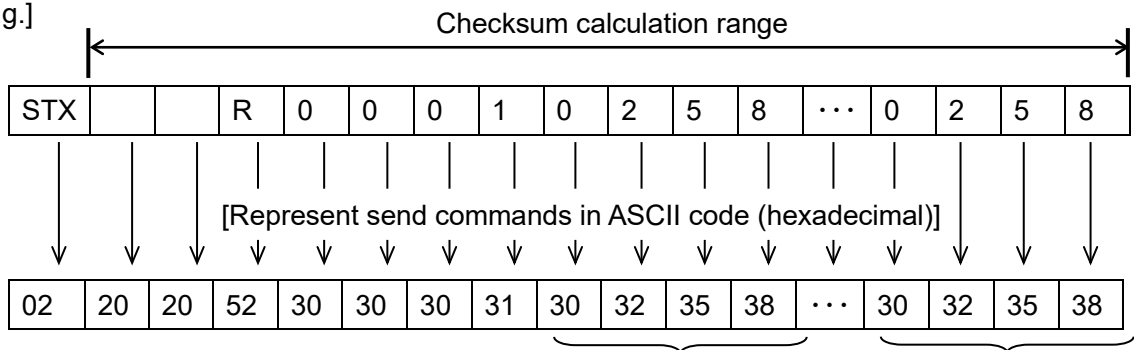

[Hexadecimal]	[Binary]
20H	0010 0000
20H	0010 0000
52H	0101 0010
30H	0011 0000
.	.
.	.
.	.
30H	0011 0000
32H	0011 0010
35H	0011 0101
+ 38H	0011 1000

1 0001 1010 1111 ⟶ [1's complement] 0101 0000

+ 1

[2's complement] 0101 0001

[Hexadecimal] 5 1

[Sending code] [ASCII code] 35H 31H

02	20	20	52	30	30	30	31	30	32	35	38	···	30	32	35	38

35	31	03

Checksum
13.3 Message Example

Numerals written below the command represent number of characters.

(1) Setting [Address 0, Data 1 to Data 20, SV=600 °C (0258H)]

• Stting command from the master

Header (02H)	Address (20H)	Subaddress (20H)	Command type (52H)	Data item (30H)(30H)(30H)(31H)	
1	1	1	1	4

13.4 Communication Command List

Command type		Data item	Data section
22H/52H	0001H	SV setting	Setting value
22H/52H	0002H	Proportional band setting (*1)	Setting value
22H/52H	0003H	Integral time setting	Setting value
22H/52H	0004H	Derivative time setting	Setting value
22H/52H	0005H	Alarm 1 (high limit) setting	Setting value
22H/52H	0006H	Alarm 2 (low limit) setting	Setting value
22H/52H	0007H	Proportional cycle setting	Setting value
22H/52H	0008H	Heater burnout alarm setting(*2)	Setting value
22H/52H	0009H	Control action execution / stop selection	0000H: Control stop 0001H: Control execution
22H/52H	000AH	AT perform/cancel selection	0000H: AT cancel 0001H: AT perform
22H/52H	000BH	Alarm 1 (high limit) hysteresis setting	Setting value
22H/52H	000CH	Alarm 2 (low limit) hysteresis setting	Setting value
22H/52H	000DH	Control output ON/OFF hysteresis setting	Setting value
22H/52H	000EH	Control output high limit setting	Setting value
22H/52H	000FH	Control output low limit setting	Setting value
22H/52H	0010H	PV filter setting	Setting value
22H/52H	0011H	Temperature unit selection	0000H: °C 0001H: °F
22H/52H	0012H	Control action selection	0000H: Heating (Reverse action) 0001H: Cooling (Direct action)

(*1): The setting range of the proportional band is different between the QTC1-☐0 and the C series.
For thermocouple or RTD input, convert the C series setting to °C (°F).

	QTC1-☐0	C series
Proportional band range	1 to Input span °C or 0.1 to Input span °C For DC current input and DC voltage input: 0.10 to 100.00 %	0.0 to 100.0 %

(*2): CH1 to CH4 correspond to the CT input connectors CT1 to CT4 respectively.
When the CT is connected to CT3 in single phase, set to CH3.
When the CT is connected to CT1 and CT3 in 3 phase , set to CH1 and CH3.

Command type	Data item		Data section
22H/52H	0013H	Alarm 1 type selection(*1)	0000H: No action 0001H: High limit 0002H: High limit with standby 0003H: Low limit 0004H: Low limit with standby 0005H: High/Low limits 0006H: High/Low limits with standby 0007H: High/Low limits range 0008H: High/Low limits range with standby 0009H: Process high limit 000AH: Process high limit with standby 000BH: Process low limit 000CH: Process low limit with standby
22H/52H	0014H	Alarm 2 type selection(*1)	Same as alarm 1 type selection
22H/52H	0015H	Loop break alarm band setting	Setting value
22H/52H	0016H	Loop break alarm time setting	Setting value
22H/52H	0017H	Reservation(*2)	
22H/52H	0018H	Reservation(*2)	
22H/52H	0019H	Sensor correction setting	Setting value
22H/52H	001AH	Reservation(*2)	
22H/52H	001BH	Reservation(*2)	

(*1): The selected value of alarm type selection of QTC1-□0 is different from the selected value of alarm type selection of C series.
Refer to the table below and replace the selected value of C series with the selected value of QTC1-□0.

Alarm type	C series	QTC1-□0
No action	0000H	0000H
High limit	0001H	0001H
High limit with standby	0002H	0007H
Low limit	0003H	0002H
Low limit with standby	0004H	0008H
High/Low limits	0005H	0003H
High/Low limits with standby	0006H	0009H
High/Low limits range	0007H	0004H
High/Low limits range with standby	0008H	Cannot select
Process high limit	0009H	0005H
Process high limit with standby	000AH	Cannot select
Process low limit	000BH	0006H
Process low limit with standby	000CH	Cannot select

(Example)
If high/Low limits alarm is used for C series, change 0005H to 0003H when replacing with QTC1-□0.

(*2): The reservation item returns 0 of acknowledgement when it is read.
When it is set, it returns acknowledgement and discards the data.

Command type		Data item	Data section
22H/52H	001CH	Cooling P-band setting (*1)	Setting value
22H/52H	001DH	Cooling proportional cycle setting	Setting value
22H/52H	001EH	Overlap/Dead band setting	Setting value
22H/52H	001FH	Cooling action mode selection	0000H: Air cooling 0001H: Oil cooling 0002H: Water cooling
22H/52H	0020H	Cooling ON/OFF hysteresis setting	Setting value
	0040H	Reservation(*2)	

22H/52H	0041H	Event output selection (*3)	CH1
			B0: DO1
			    0: OFF 1: ON
			B1: DO2
			    0: OFF 1: ON
			B2: DO3
			    0: OFF 1: ON
			B3: DO4
			    0: OFF 1: ON

22H	0042H	Event input state reading (*4)	CH1
			B0: DI1
			    0: OFF 1: ON
			B1: DI2
			    0: OFF 1: ON
			B2: DI3
			    0: OFF 1: ON
			B3: DI4
			    0: OFF 1: ON

(*1):   The setting range of the cooling P-band is different between the QTC1-□0 and the C series.
For thermocouple or RTD input, convert the C series setting to °C (°F).

	QTC1-□0	C series
Cooling P-band range	1 to Input span °C or 0.1 to Input span °C For DC current input and DC voltage input: 0.10 to 100.00 %	Magnification against the heating P-band. 0.0 to 10.0

(*2):   The Reservation item returns 0 of acknowledgement when it is read.
When it is set, it returns acknowledgement and discards the data.

(*3):   Event output selection is enabled when "no action" is selected in the event output allocation selection.
If set the data from data 2 to data 20, the acknowledgement will be returned and the data will be discarded.

(*4):   The event input status reading always returns the event input status as data.
If read the data from data 2 to data 20, the acknowledgement returns 0.

Read only

Command type		Data item	Data section
22H	0080H	Read PV	PV
22H	0081H	Read MV	MV
22H	0082H	Read heater current value	Heater current value

22H	0083H	Read state 1	B0: Control output

14　Communication with PLC Using SIF Function

The SIF function is a function that reads and writes various data to the PLC register using the PLC communication protocol through a serial connection with a Mitsubishi Electric PLC, OMRON PLC (*), or KEYENCE PLC(*).

(*) When using the SIF function to connect to a PLC manufactured by OMRON Corporation or KEYENCE CORPORATION, cannot be connected with RS-485 communication method.
　　Only RS-422A communication type can be connected.

The following communication protocols and commands are supported.
The station number of the PLC is fixed at 0.

PLC manufacturer name	Communication protocol	Communication command
Mitsubishi Electric Corporation	Form 4	A compatible 1C frame AnA/AnU common command (QR/QW)
OMRON Corporation		FINS command I/O memory type: 82(DMxxxxxx) Command code 0101/0102
KEYENCE CORPORATION	KV mode (upper link)	KV command (RDS/WRS)

In the console software (SWC-QMC101M), select the start number of the PLC register, the address of the PLC register, and the linked monitor item and setting item to set the specifications.

This product acts as a master and writes the selected items to the PLC register cyclically using each communication command, and updates the PLC register value constantly.
In addition, the selected setting item is read from the PLC register by setting request using each communication command, and if the read data is changed, the setting value of QTC1-40 is updated.
When QTC1-20 is connected, CH3 and CH4 do not function.

Connection example of QMC1 and QTC1-40
(Fig. 14-1)

14.1 Procedure Before Starting Operation

The procedure up to the start of operation when connecting to the PLC is shown below.

Selecting communication specification of QMC1	Selects the communication specifications of QMC1, such as communication speed, data bits, and parity.
Selecting module address of QMC1	Select the module address of QMC1.
Mounting QMC1	Mount the QMC1 to the DIN rail.
Wiring of QMC1	Wire the QMC1.
Specification settings for QMC1	To communicate with the PLC, set the specifications of QMC1.
Connecting PLC and QMC1	Connect the PLC to the QMC1.
Setting communication parameter of PLC	Select the communication parameters of the PLC.
Operation start	Communication between PLC and QMC1 is performed, and operation is started.

(Fig. 14.1-1)

14.2 Selecting Communication Specification of QMC1

The communication specification can be selected by the communication specification selection dip switch on the left side of this instrument.
(Fig. 14.2-1)

Select the communication speed, data bit, parity, and stop bit.

The factory default settings are all OFF.

- Communication speed: 9600 bps
- Data bit: 8 bits
- Parity Enable/Disable: Enable
- Parity Even/Odd: Even
- Stop bit: 1 bit

(1) Communication speed

Communication specification selection dip switch		Communication speed
1	2	
OFF	OFF	9600 bps
ON	OFF	19200 bps
OFF	ON	38400 bps
ON	ON	57600 bps

(2) Data bit

Communication specification selection dip switch	Data bit
3	
OFF	8 bits
ON	7 bits

(3) Parity Enable/Disable

Communication specification selection dip switch	Parity Enable/Disable
4	
OFF	Enable
ON	Disable

(4) Parity Even/Odd

Communication specification selection dip switch	Parity Even/Odd
5	
OFF	Even
ON	Odd

(5) St op bit

Communication specification selection dip switch	St op bit
6	
OFF	1 bit
ON	2 bits

Dip switches No.7 and No.8 does not use. Leave it OFF.

14.3 Selecting Module Address of QMC1

<div>

⚠ Caution

• When used with the SIF function, it is not necessary to select the module address.

</div>

The module address is selected with the rotary switch.

Module address selection
rotary switch
(Fig. 14.3-1)

When used with the SIF function, it is not necessary to select the module address.
Please leave it as 0.

14.4 Mounting QMC1

Mounting to the DIN rail

①   Lower the lock lever of this instrument. (The lock lever of this instrument has a spring structure, but if lower it in the direction of the arrow until it stops, it will be locked in that position.)

②   Hook the part ② of this instrument onto the top of the DIN rail.

③   Insert the lower part of this instrument with the part ② as a fulcrum.

④   Raise the lock lever of this instrument.
     Make sure it is fixed to the DIN rail.
(Fig. 14.4-1)   (Fig. 14.4-2)

Removal from the DIN rail

①   Insert a flat blade screwdriver into the lock lever of this instrument and lower the lock lever until it stops.

②   Remove this instrument from the DIN rail by lifting it from below.
(Fig. 14.4-3)

Mounting multiple modules to the DIN rail

This section describes an example of mounting this instrument and QTC1-40 on the DIN rail.

① Lower the lock lever of the QTC1-40, and mounting the QTC1-40 to the DIN rail.

② Slide the QTC1-40 to the left and connect the connectors to each other.
(Fig. 14.4-4)

③ Raise the lock lever of the QTC1-40.

Make sure it is fixed to the DIN rail.
(Fig. 14.4-5)

Removal multiple modules from the DIN rail

This section describes an example of removing multiple control modules QTC1-40 on the DIN rail.

①   Insert a flat blade screwdriver into the lock lever of the QTC1-40 and lower the lock lever until it stops.

②   Slide the QTC1-40 to the right side and disconnect it from the connector, then remove it from the DIN rail.

QMC1   QTC1-40
(Fig. 14.4-6)

14.5 Wiring of QMC1

14.5.1 Wiring for Power Supply

The terminal block for power supply is located on the base of this instrument.

Wiring by the following procedure.

(1) Case removal

    ① Push the release lever on the top of this instrument to unlock it.

    ② Remove the case.

(Fig. 14.5.1-1)

(2) Wiring

⚠ **Caution**

• Do not confuse the polarities.
• Use the ring-type solderless terminal.
• The tightening torque should be 0.5 N•m.

Power supply

+ −

24 V DC
(Fig. 14.5.1-2)

(3) Case mounting

    ① Hook the case on the lower part ① of this instrument.

    ② Mount the case so that the lower part ① of this instrument is the fulcrum and covers the release lever.

       There is a clicking sound.
(Fig. 14.5.1-3)

14.5.2 Wiring for Event Input and Event Output

For wiring of the event input/output, use the wiring connector [0225 0805 (made by DINKLE)] (sold separately).
(Fig. 14.5.2-1)

14.6 Specification settings for QMC1

Set the specifications of this instrument for communication with the PLC.

This section describes how to set specifications using console software (SWC-QMC101M).

14.6.1 Preparation of USB Communication Cable and Console Software

Please prepare the USB communication cable and the console software.

- USB commu nication cable

  USB - micro USB Type B (commercial item)
- Console software SWC-QMC101M)

  Please download from our website and install.

  Click   https://shinko-technos.co.jp/e/ → Support/Download → Software

14.6.2 Connecting to Host Computer

⚠ **Caution**

Do not use the logging function of the console software when communicating by connecting the USB communication cable.

---

(1)   Connect the micro USB Type B side of the USB communication cable to the console communication connector of this instrument.

(2)   Connect the USB plug of the USB communication cable to the USB port of the host computer.

Connection example of QMC1 and QTC1-40
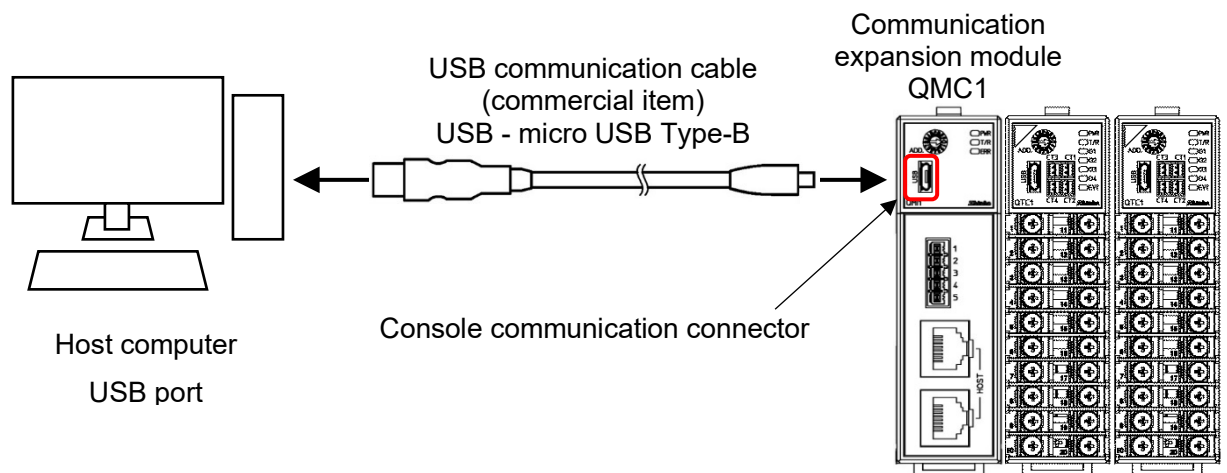

(Fig. 14.6.2-1)

(3)   Checking the COM port number

Follow the procedure below to check the COM port number.

①   Right-click "Start" → Click "Device manager" from menu.

②   When "USB Serial Port (COM3)" is displayed in "Port (COM and LPT)", the COM port is assigned to No. 3.

Check the COM port number, and then close "Device Manager".

③   Start the console software (SWC-QMC101M).
(Fig. 14.6.2-2)

④   When start the console software for the first time, the communication condition setting screen is displayed.

If the communication condition settings have been completed, proceed to ⑦.

(Fig. 14.6.2-3)

14-13
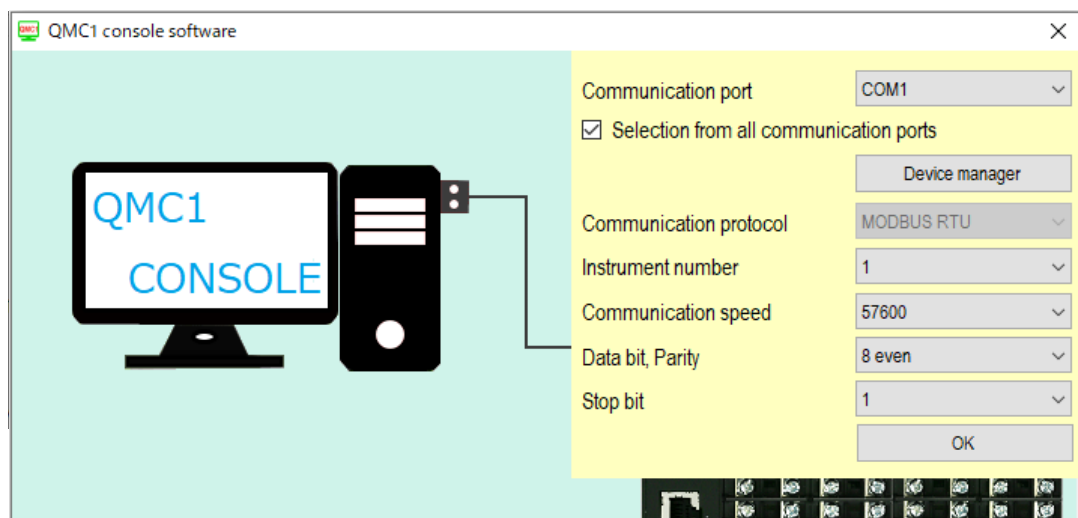

⑤　Set the communication condition as shown below.

Setup Items	Setting Value
Communication port	Select the COM port number confirmed in ②.
Communication protocol	MODBUS RTU

⑥　Click [OK].

⑦　Click "User (U)" in the menu bar – "Default setting of SIF function (S)".

Display "Default setting of SIF function" screen.
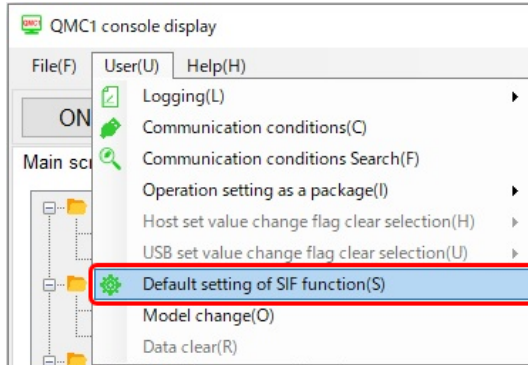

(Fig. 14.6.2-4)

⑧　Select "Module 1" and click "System" tab.
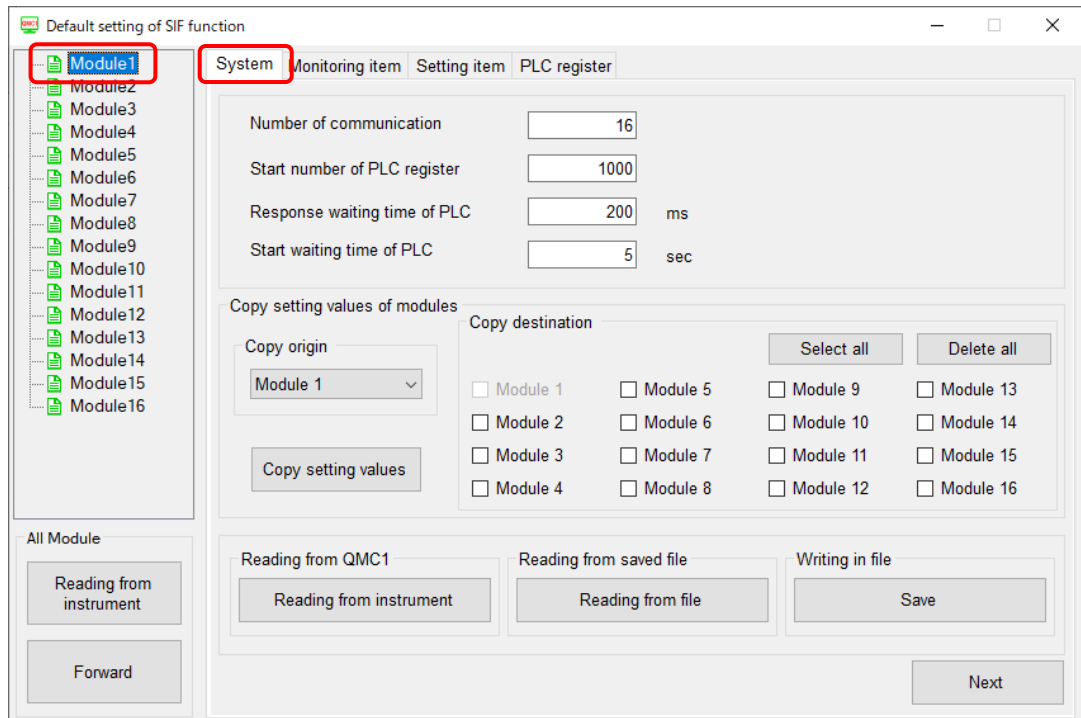

(Fig. 14.6.2-5)

Ready to set the specifications.

14.6.3 Specification settings for QMC1

Default setting of SIF function
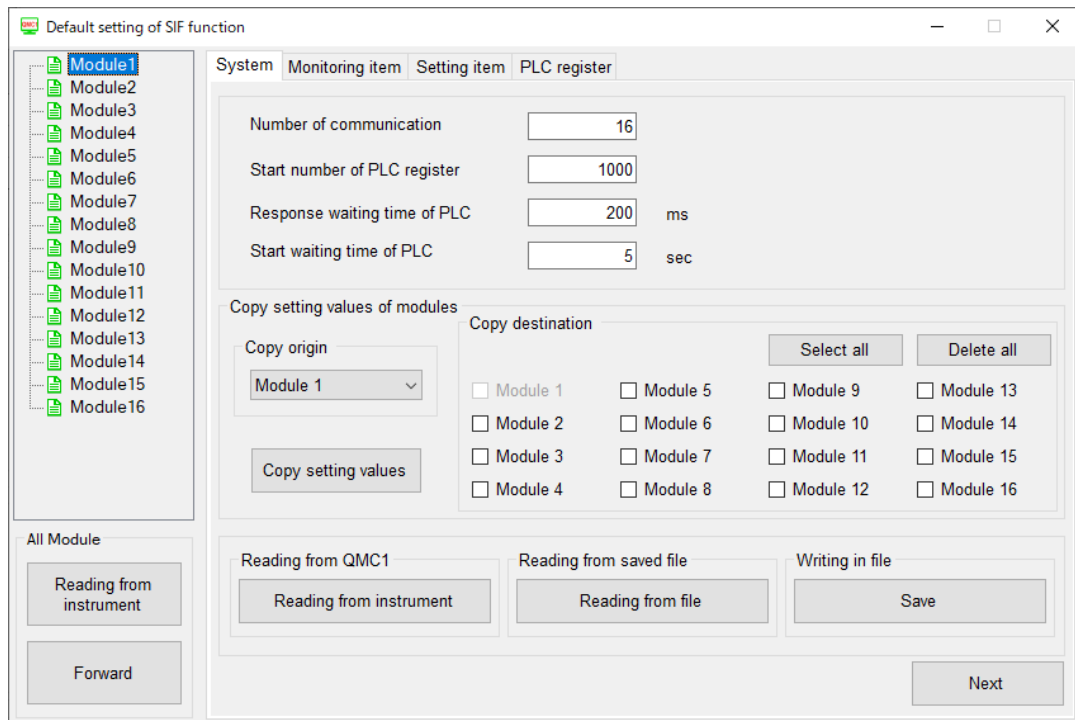

(Fig. 14.6.3-1)

Please refer to the Default setting of SIF function item to set the specifications.

Default setting of SIF function item

Module 1

MODBUS address	Name	Setting and selection range	Factory default
5280	Number of communication	1 to 16 modules	1
0064	Start number of PLC register	0 to 65535	1000
0074	Response waiting time of PLC	100 to 3000 ms	200
0084	Start waiting time of PLC	1 to 255 seconds	5
0094	Reservation (Not used)		0
00A4	Reservation (Not used)		0
00B4	Monitoring item 1 selection	See monitoring item 1 table. (P.14-18)	31
00C4	Monitoring item 2 selection	See monitoring item 2 table. (P.14-18)	0
00D4	Monitoring item 3 selection	See monitoring item 3 table. (P.14-19)	0
00E4	Reservation (Not used)		0
00F4	Reservation (Not used)		0
0104	Setting item 1 selection	See setting item 1 table. (P.14-20)	57827
0114	Setting item 2 selection	See setting item 2 table. (P.14-21)	2721
0124	Setting item 3 selection	See setting item 3 table. (P.14-21)	0
0134	Setting item 4 selection	See setting item 4 table. (P.14-22)	0
0144	Setting item 5 selection	See setting item 5 table. (P.14-22)	0
0154	Setting item 6 selection	See setting item 6 table. (P.14-23)	0
0164	Setting item 7 selection	See setting item 7 table. (P.14-23)	0

(1) Number of communication

Set the number of units to be managed by this instrument.

Set the number of control modules that are connected to this instrument.

(2) Start number of PLC register

Set the start number of the register used for PLC communication.

Set it in the range of 0 to 65535.

In the case of Mitsubishi Electric Corporation's PLC (A compatible 1C frame AnA/AnU), set the number in the range of 0 to 8191.

Initial value: Value of module 1 + {(module address - 1)×100}

For module 1: initial value=1000+{(1-1)×100}=1000

For module 2: initial value=1000+{(2-1)×100}=1100

For module 16: initial value=1000+{(16-1)×100}=2500

A maximum of 170 registers are used per control module. System area: 10 registers, monitoring items: 80 registers (20 x 4 ch), setting items: 80 registers (20 x 4 ch)]

When using multiple control modules, be careful not to duplicate them.

(3) Response waiting time of PLC

Sets the retransmission interval time when there is no response from the PLC.

Set it in the range of 100 to 3000 ms.

(4) Start waiting time of PLC

Set the time until communication with the PLC starts after this instrument is turned on.

Set it in the range of 1 to 255 seconds.

(5) Monitoring items 1 to 3 selection

Click "Monitoring Item" tab or [Next] button.

Display "Monitoring item" screen.
(Fig. 14.6.3-2)

Select any of the monitoring items 1 to 3.

1: Enable, 0: Disable.

The maximum number of items that can be selected is 20.

This is common for all channels in the control module, and excess data is invalid.

Monitoring item 1 selection (Initial value: 31)

Bit	Number	Selection	Description
0	01	1	PV resding (including difference)
1	02	1	MV
2	03	1	SV
3	04	1	Status 1
4	05	1	Status 2
5	06	0	Heater current value
6	07	0	Event input
7	08	0	Event output
8	09	0	PV resding (true value)
9	10	0	Reading ambient temperature
10	11	0	Not used
11	12	0	Not used
12	13	0	Not used
13	14	0	Not used
14	15	0	Not used
15	16	0	Not used

Monitoring item 2 selection (Initial value: 0)

Bit	Number	Selection	Description
0	17	0	Content of error history 1
1	18	0	Content of error history 2
2	19	0	Content of error history 3

13	46	0	Not used
14	47	0	Not used
15	48	0	Not used

(6) Setting items 1 to 7 selection

Click "Setting Item" tab or [Next] button.

Display "Settinging item" screen.
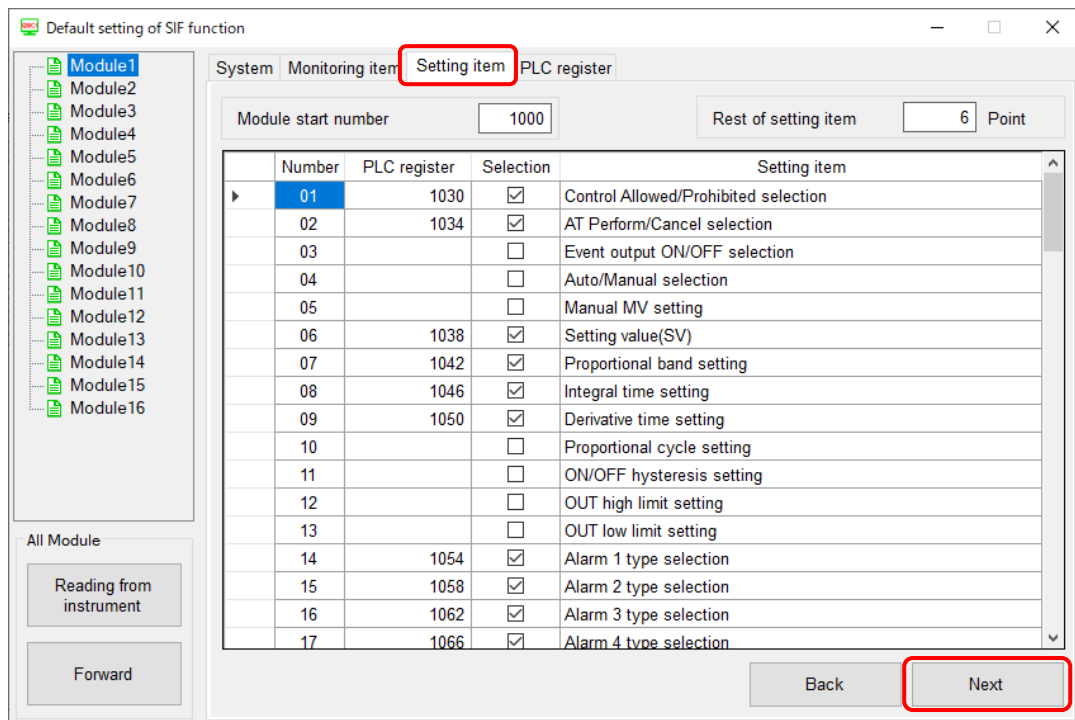

(Fig. 14.6.3-3)

Select any of the setting items 1 to 7.

1: Enable, 0: Disable.

The maximum number of items that can be selected is 20.

This is common for all channels in the control module, and excess data is invalid.

Setting item 1 selection (Initial value: 57827)

Bit	Setting request item number	Selection	Description
0	1	1	Control Allowed/Prohibited selection
1	2	1	AT Perform/Cancel selection
2	3	0	Event output ON/OFF selection
3	4	0	Auto/Manual selection
4	5	0	Manual MV setting
5	6	1	Setting value (SV)
6	7	1	Proportional band setting
7	8	1	Integral time setting
8	9	1	Derivative time setting
9	10	0	Proportional cycle setting
10	11	0	ON/OFF hysteresis setting
11	12	0	OUT high limit setting
12	13	0	OUT low limit setting
13	14	1	Alarm 1 type selection
14	15	1	Alarm 2 type selection
15	16	1	Alarm 3 type selection

Setting item 2 selection (Initial value: 2721)

Bit	Setting request item number	Selection	Description
0	17	1	Alarm 4 type selection
1	18	0	Alarm 1 hysteresis setting
2	19	0	Alarm 2 hysteresis setting
3	20	0	Alarm 3 hysteresis setting
4	21	0	Alarm 4 hysteresis setting
5	22	1	Alarm 1 value setting
6	23	0	Alarm 1 high limit value setting
7	24	1	Alarm 2 value setting
8	25	0	Alarm 2 high limit value setting
9	26	1	Alarm 3 value setting
10	27	0	Alarm 3 high limit value setting
11	28	1	Alarm 4 value setting
12	29	0	Alarm 4 high limit value setting
13	30	0	Heater burnout alarm setting
14	31	0	Loop break alarm band setting
15	32	0	Loop break alarm time setting

Setting item 3 selection (Initial value: 0)

Bit	Setting request item number	Selection	Description
0	33	0	Sensor correction factor setting
1	34	0	Sensor correction setting
2	35	0	PV filter time constant setting
3	36	0	SV rise rate setting
4	37	0	SV drop rate setting
5	38	0	MV bias setting
6	39	0	Not used
7	40	0	Not used
8	41	0	Not used
9	42	0	Not used
10	43	0	Not used
11	44	0	Not used
12	45	0	Not used
13	46	0	Not used
14	47	0	Not used
15	48	0	Not used

Setting item 4 selection (Initial value: 0)

Bit	Setting request item number	Selection	Description
0	49	0	Input type selection
1	50	0	Temperature unit selection
2	51	0	Scaling high limit setting
3	52	0	Scaling low limit setting
4	53	0	Input sampling selection
5	54	0	Direct/reverse action selection
6	55	0	AT action mode selection
7	56	0	AT bias setting
8	57	0	AT gain setting
9	58	0	Alarm 1 value 0 Enabled/ Disabled selection
10	59	0	Alarm 2 value 0 Enabled/ Disabled selection
11	60	0	Alarm 3 value 0 Enabled/ Disabled selection
12	61	0	Alarm 4 value 0 Enabled/ Disabled selection
13	62	0	Event output allocation selec tion
14	63	0	Event input allocation selection
15	64	0	CH Enabled/ Disabled selection

Setting item 5 selection (Initial value: 0)

Bit	Setting request item number	Selection	Description
0	65	0	Number of moving average setting
1	66	0	Input math function selection
2	67	0	Input difference selection
3	68	0	Input difference setting
4	69	0	Control action selection
5	70	0	Proportional gain 2 DOF coefficient setting (α)
6	71	0	Integral 2 DOF coefficient setting (β)
7	72	0	Differential 2 DOF coefficient setting (γ, Cd)
8	73	0	Desired value proportional coefficient setting (Cp)
9	74	0	Gap width setting
10	75	0	Gap coefficient setting
11	76	0	Output minimum ON/OFF time setting
12	77	0	Integral/ differential decimal point position selection
13	78	0	Power on restore action selection
14	79	0	Not used
15	80	0	Not used

Setting item 6 selection (Initial value: 0)

Bit	Setting request item number	Selection	Description
0	81	0	Control function selection
1	82	0	Cooling P-band setting
2	83	0	Cooling integral time setting
3	84	0	Cooling differential time setting
4	85	0	Cooling proportional cycle setting
5	86	0	Cooling ON/OFF hysteresis setting
6	87	0	Overlap/Dead band setting
7	88	0	Cooling output high limit setting
8	89	0	Cooling output low limit setting
9	90	0	Cooling action mode selection
10	91	0	Slave scale high limit setting
11	92	0	Slave scale low limit setting
12	93	0	Output bias setting
13	94	0	Output gain setting
14	95	0	Output channel selection
15	96	0	Output rate-of-change setting

Setting item 7 selection (Initial value: 0)

Bit	Setting request item number	Selection	Description
0	97	0	Communication response delay time setting
1	98	0	Expanded function selection
2	99	0	Total current setting
3	100	0	Current value setting
4	101	0	Output ON delay setting
5	102	0	Auto balance control Interlock/Single selection
6	103	0	Auto balance control Master/Slave selection
7	104	0	Auto balance control Enable/Disable selection
8	105	0	Auto balance control start output setting
9	106	0	Auto balance control cancel area setting
10	107	0	Number of communication management module setting
11	108	0	Non-volatile IC memory save selection
12	109	0	Not used
13	110	0	Not used
14	111	0	Not used
15	112	0	Not used

(7) PLC register check

Click "PLC register" tab or [Next] button.
Display "PLC register" screen.
Check the settings.
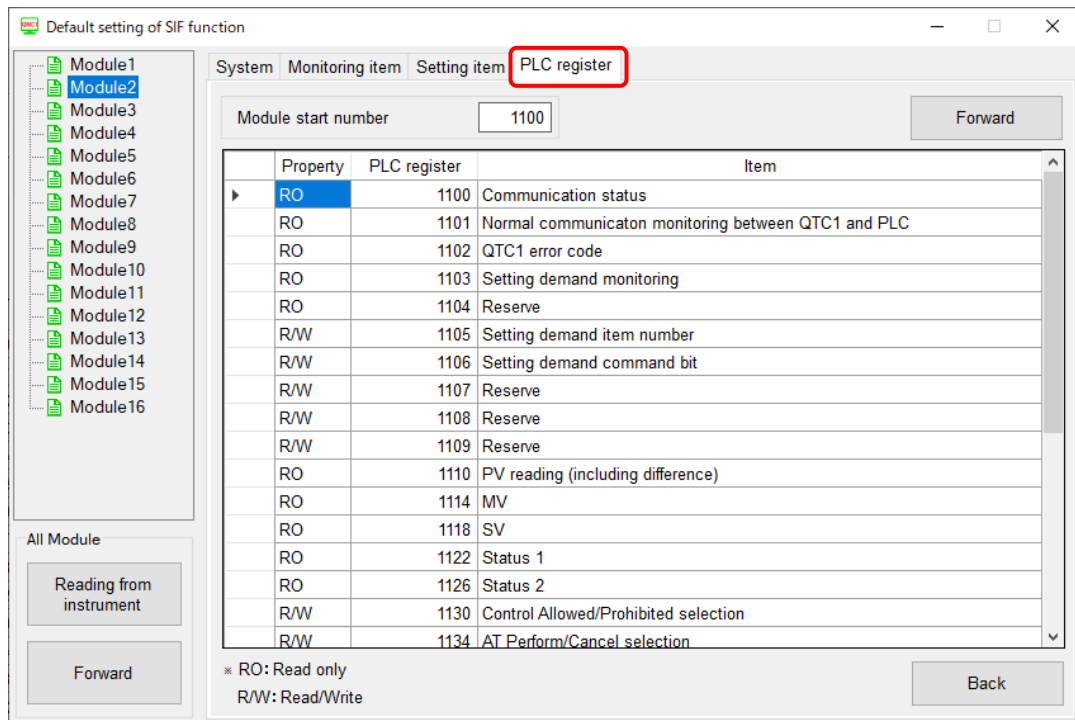

(Fig. 14.6.3-4)

(8) Transfer of setting values

Click [Forward] button.
Transfer the setting value to module 1.
(Fig. 14.6.3-5)

(9) Turn OFF → ON the QMC-1 power.

Turn OFF → ON the power of QMC-1. The set value will become effective.

This completes the specification setting.

[Useful Functions] Copying the set values of modules

When you select the source module and the destination module, and then click the Copy Setting Value button, the selected contents of the monitor items 1 to 3 and the setting items 1 to 7 can be copied by the Copy Setting Value of Module in the System tab of Module 1.

The module set value copy is a copy function on the console software screen.
(Fig. 14.6.3-6)

Specification settings when multiple control modules are connected

When multiple control modules are connected, select the connected module number (e.g. Module 2), and click the System tab.

(Fig. 14.6.3-7)

14-25
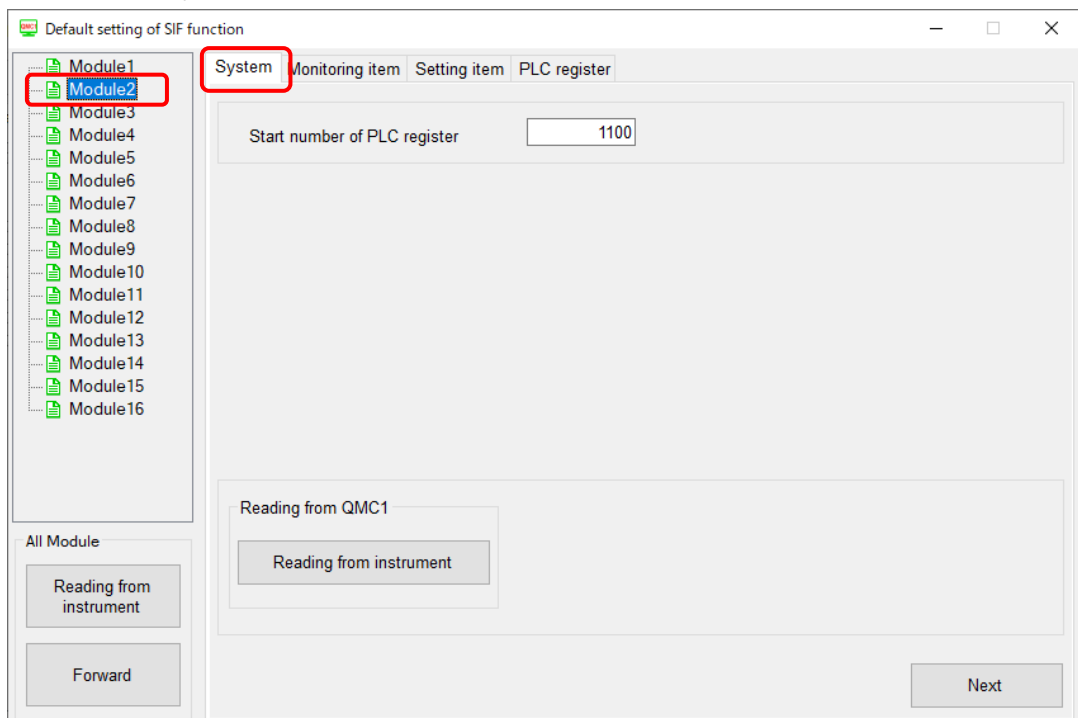

(10) Setting the specifications for Module 2

Set "(2) Start number of PLC register", "(5) Monitoring items 1 to 3 selection", "(6) Setting items 1 to 7 selection",and then "(7) PLC register check", "(8) Transfer of setting values", "(9) Turn the QMC1 power OFF → ON".

Module 2

MODBUS address	Name	Setting and selection range	Factory default
0065	Start number of PLC register	0 to 65535	1100
0075	Reservation (Not used)		0
0085	Reservation (Not used)		0
0095	Reservation (Not used)		0
00A5	Reservation (Not used)		0
00B5	Monitoring item 1 selection	See monitoring item 1 table. (P.14-18)	31
00C5	Monitoring item 2 selection	See monitoring item 2 table. (P.14-18)	0
00D5	Monitoring item 3 selection	See monitoring item 3 table. (P.14-19)	0
00E5	Reservation (Not used)		0
00F5	Reservation (Not used)		0
0105	Setting item 1 selection	See setting item 1 table. (P.14-20)	57827
0115	Setting item 2 selection	See setting item 2 table. (P.14-21)	2721
0125	Setting item 3 selection	See setting item 3 table. (P.14-21)	0
0135	Setting item 4 selection	See setting item 4 table. (P.14-22)	0
0145	Setting item 5 selection	See setting item 5 table. (P.14-22)	0
0155	Setting item 6 selection	See setting item 6 table. (P.14-23)	0
0165	Setting item 7 selection	See setting item 7 table. (P.14-23)	0

(11) Setting the specifications for Module 3 and later

The SIF function initial setting items for Module 3 and later are shown below.

If necessary, set the specifications in the same way.

Module 3

MODBUS address	Name	Setting and selection range	Factory default
0066	Start number of PLC register	0 to 65535	1200
0076	Reservation (Not used)		0
0086	Reservation (Not used)		0
0096	Reservation (Not used)		0
00A6	Reservation (Not used)		0
00B6	Monitoring item 1 selection	See monitoring item 1 table. (P.14-18)	31
00C6	Monitoring item 2 selection	See monitoring item 2 table. (P.14-18)	0
00D6	Monitoring item 3 selection	See monitoring item 3 table. (P.14-19)	0
00E6	Reservation (Not used)		0
00F6	Reservation (Not used)		0
0106	Setting item 1 selection	See setting item 1 table. (P.14-20)	57827
0116	Setting item 2 selection	See setting item 2 table. (P.14-21)	2721
0126	Setting item 3 selection	See setting item 3 table. (P.14-21)	0
0136	Setting item 4 selection	See setting item 4 table. (P.14-22)	0
0146	Setting item 5 selection	See setting item 5 table. (P.14-22)	0
0156	Setting item 6 selection	See setting item 6 table. (P.14-23)	0
0166	Setting item 7 selection	See setting item 7 table. (P.14-23)	0

Module 4

MODBUS address	Name	Setting and selection range	Factory default
0067	Start number of PLC register	0 to 65535	1300
0077	Reservation (Not used)		0
0087	Reservation (Not used)		0
0097	Reservation (Not used)		0

PLC data register layout

In the example of the initial setting of the SIF function, the layout of the PLC data registers is as follows.

Module number	Information between QMC1 and PLC (System data)	Monitoring item	Setting item
Module 1	1000 to 1009	1010 to 1029	1030 to 1085
Module 2	1100 to 1109	1110 to 1129	1130 to 1185
Module 3	1200 to 1209	1210 to 1229	1230 to 1285
Module 4	1300 to 1309	1310 to 1329	1330 to 1385
Module 5	1400 to 1409	1410 to 1429	1430 to 1485
Module 6	1500 to 1509	1510 to 1529	1530 to 1585
Module 7	1600 to 1609	1610 to 1629	1630 to 1685
Module 8	1700 to 1709	1710 to 1729	1730 to 1785
Module 9	1800 to 1809	1810 to 1829	1830 to 1885
Module 10	1900 to 1909	1910 to 1929	1930 to 1985
Module 11	2000 to 2009	2010 to 2029	2030 to 2085
Module 12	2100 to 2109	2110 to 2129	2130 to 2185
Module 13	2200 to 2209	2210 to 2229	2230 to 2285
Module 14	2300 to 2309	2310 to 2329	2330 to 2385
Module 15	2400 to 2409	2410 to 2429	2430 to 2485
Module 16	2500 to 2509	2510 to 2529	2530 to 2585

14.7 Communication with PLC Manufactured by Mitsubishi Electric Corporation

This section describes communication with the PLC manufactured by Mitsubishi Electric Corporation.

14.7.1 Communication parameter setting

The communication parameter settings should be set as follows.

For details, refer to the instruction manual of the PLC to be used.
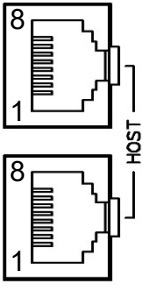

Setting item	Setting description
Communication Protocol Setting	Format 4
Station number	00
Computer link/multidrop link selection	Computer link
Operation setting	Independence
Data bits	7 bits
Parity bit	With parity/even
Stop bit	1 bit
Thumb check code	With thumb check code
Write during RUN	Permission
Setting change	Permission
Communication speed setting	Set the same communication speed as this instrument.

14.7.2 Connecting PLC and QMC1

Serial communication connector pin assignment

The pin assignment of the serial communication connector differs depending on the model name.

The connector is common to the upper and lower sections.

Pin No. \ Model	QMC1-C4□-□	QMC1-C5□-□
8	NC	NC
7	SG	SG
6	RD(+)	NC
5	SD(+)	YB(+)
4	SD(-)	YA(-)
3	RD(-)	NC
2	SG	SG
1	NC	NC

Serial communication connector

(Fig. 14.7.2-1)

For RS-422A

Use the communication cable CQM-002 (sold separately) for connection.
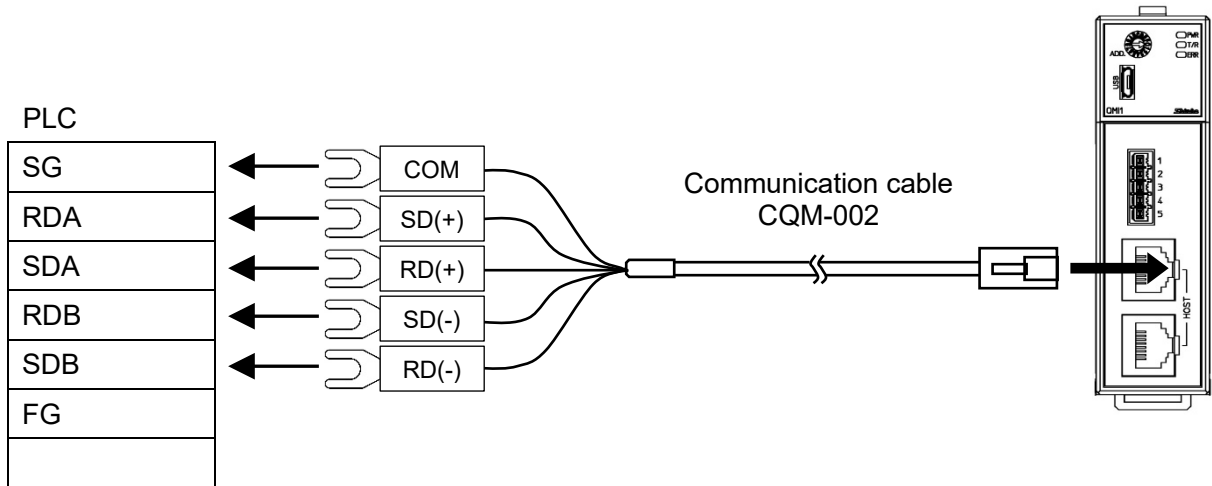

PLC

SG	←	COM
RDA	←	SD(+)
SDA	←	RD(+)
RDB	←	SD(-)
SDB	←	RD(-)
FG		

Communication cable
CQM-002

For details of the PLC side terminals, refer to the instruction manual of the PLC to be used.

(Fig. 14.7.2-2)

For RS-485

Use the communication cable CQM-001 (sold separately) for connection.
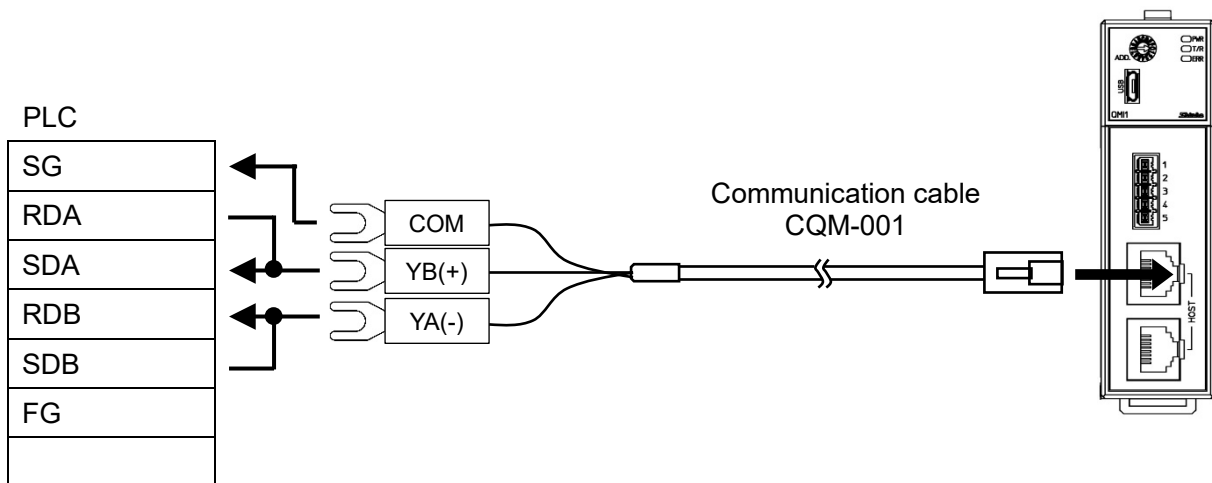

PLC

14-37

14.7.3 Communication Procedure

This section describes the case where this instrument and two QTC1-40 modules are connected to PLC.
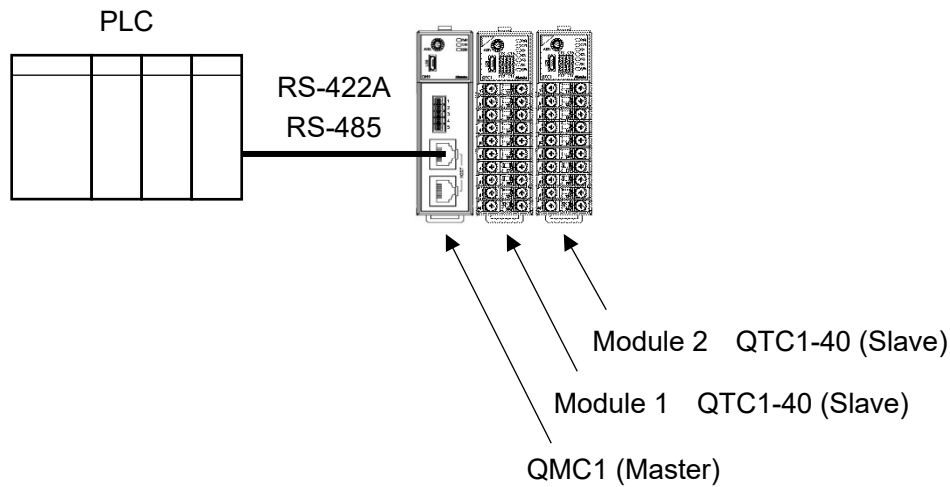

(Fig. 14.7.3-1)

(1) This instrument becomes the master and collects the valid monitor items and setting items of module 1 and module 2 [QTC1-40 (slave)].

(2) After the PLC communication start waiting time elapses, this instrument periodically writes the item selected in the monitor item to the PLC register.
In addition, the item selected in the setting item is read from the PLC register by the setting request.

All items   Reading items: Items selected by monitoring item selection
                   Writing items: At startup: Items selected by setting item selection
                                  After startup: Items set by setting request item number
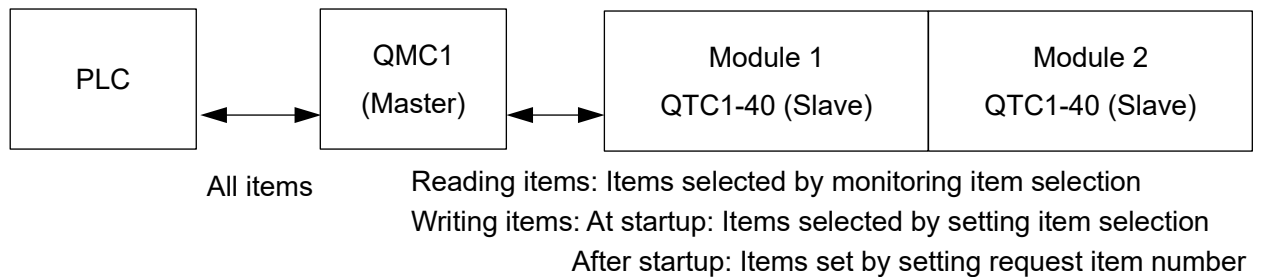

(Fig. 14.7.3-2)

14.7.4 Handshake between QMC1 and PLC

```

After the PLC communication start waiting time elapses, QMC1 reads the system data in PLC registers 0 to 9.

When QMC1 completes data collection, the communication status becomes 1, and it is ready to communicate with the PLC.

QMC1 writes system data to PLC registers 0 to 4.

QMC1 writes the monitoring item in PLC registers 10 to 49. However, if it is not selected in the monitoring item selection, it is skipped.

QMC1 writes the monitoring item in PLC registers 50 to 89. However, if it is not selected in the monitoring item selection, it is skipped.

QMC1 reads the data of the setting item of PLC register 90 to 129. However, if the setting request of the setting request command is not set, it is skipped.

QMC1 reads the data of the setting item of PLC register 130 to 169. However, if the setting request of the setting request command is not set, it is skipped.

QMC1 writes the data of the setting item to PLC registers 90 to 129. However, if the monitor request of the setting request command is not set, it is skipped.

QMC1 writes the data of the setting item to PLC registers 130 to 169. However, if the monitor request of the setting request command is not set, it is skipped.

Process	Description
System data 10WORD reading	QMC1 reads the system data in PLC registers 0 to 9.
System data 5WORD (RO) writing	QMC1 writes system data to PLC registers 0 to 4.
Monitor item 40WORD (RO) writing 1	QMC1 writes the monitoring item in PLC registers 10 to 49. However, if it is not selected in the monitoring item selection, it is skipped.
Monitor item 40WORD (RO) writing 2	QMC1 writes the monitoring item in PLC registers 50 to 89. However, if it is not selected in the monitoring item selection, it is skipped.
Setting item 40WORD reading 1	QMC1 reads the data of the setting item of PLC register 90 to 129. However, if the setting request of the setting request command is not set, it is skipped.
Setting item 40WORD reading 2	QMC1 reads the data of the setting item of PLC register 130 to 169. However, if the setting request of the setting request command is not set, it is skipped.
Setting item 40WORD writing 1	QMC1 writes the data of the setting item to PLC registers 90 to 129. However, if the monitor request of the setting request command is not set, it is skipped.
Setting item 40WORD writing 2	QMC1 writes the data of the setting item to PLC registers 130 to 169. However, if the monitor request of the setting request command is not set, it is skipped.

Module 1
QTC1-40 (Slave)

System data 10WORD reading

System data of QTC1-40 (slave)
Returns to the 10WORD reading process.
Thereafter, the process for each control
module is repeated.

14.7.5 PLC communication data map

The following table shows the PLC communication data map when set with the SIF function initial setting example.

SIF function initial setting example

Name	Module 1 QTC1-40 (Slave)		Module 2 QTC1-40 (Slave)

PLC data register layout

	Module 1 QTC1-40 (Slave)	Module 2 QTC1-40 (Slave)
Information between QMC1 and PLC (System data)	D1000 to D1009	D1100 to D1109
Monitor item	D1010 to D1029	D1110 to D1129
Setting item	D1030 to D1085	D1130 to D1185

Details of information between QMC1 and PLC (System data)

Module 1　QTC1-40 (Slave)

Data	PLC Data register	Attribute	Description
Communication status	D1000	RO	0:　　QMC1 is collecting data from QTC1-40. 1:　　QMC1 completed data collection for QTC1-40 　　　(At startup: Initial setting values for each slave)
QMC1 - PLC Normal communication monitor	D1001	RO	Increment counter Repeat 0 to 65535　→　0 to 65535
QMC1 Error code	D1002	RO	B0:　PLC register R/W error　　0: Normal　　1: Error B1:　Between QMC1 and PLC communication error 　　　　　　　　　　　　　　　0: Normal　　1: Error B2:　Negative acknowledgement when setting from 　　　QMC1 to QTC1-40 　　　(Cleared at B0 clear of 1006) 　　　　　　　　　　　　　　　0: Normal　　1: Error
Setting request monitor	D1003	RO	B0:　At setting (Reflect and set to B0 of 1006.) B1:　At monitoring (Reflect and set until B1 of 1006 is 　　　cleared.)
Reservation	D1004	RO	
Setting request item number	D1005	R/W	0:　　　　All items selected in the setting item 1 to 7 　　　　　selection 1 to 112: Item (1 data) selected in the setting item 1 　　　　　to 7 selection 　　　　　Only the data (one data) of the selected 　　　　　item is read or written. However, since 　　　　　communication with the PLC is a batch 　　　　　process, all the selected items are read or 　　　　　written.
Setting request command (*)	D1006	R/W	B0:　Setting request (PLC → QMC1) 　　　QMC1 requests to read the data of the setting 　　　item of PLC register. B1:　Monitoring request (QMC1　→　PLC) 　　　QMC1 requests to write the data of the setting 　　　item to the PLC register. After the setting request or monitoring request is completed, QMC1 clears each bit.
Reservation	D1007	R/W	
Reservation	D1008	R/W	
Reservation	D1009	R/W	

(*):　When setting request and monitoring request are set at the same time, processing is done in the
　　　order of setting request (reading PLC register data for QMC1) and monitoring request (writing
　　　data to PLC register).
　　　If the setting request is set during the monitoring request, the monitor request is discarded and
　　　the monitoring request is made again after the setting request.

Module 2   QTC1-40 (Slave)

Data	PLC Data register	Attribute	Description
Communication status	D1100	RO	0: QMC1 is collecting data from QTC1-40. 1: QMC1 completed data collection for QTC1-40 (At startup: Initial setting values for each slave)
QMC1 - PLC Normal communication monitor	D1101	RO	Increment counter Repeat 0 to 65535 → 0 to 65535

QMC1 Error code	D1102	RO	B0: PLC register R/W error 0: Normal 1: Error
			B1: Between QMC1 and PLC communication error
			                          0: Normal 1: Error
			B2: Negative acknowledgement when setting from
			     QMC1 to QTC1-40
			     (Cleared at B0 clear of 1006)
			                             0: Normal 1: Error

Setting request monitor	D1103	RO	B0: At setting (Reflect and set to B0 of 1006.) B1: At monitoring (Reflect and set until B1 of 1006 is cleared.)
Reservation	D1104	RO	

Setting request item number	D1105	R/W	0: All items selected in the setting item 1 to 7
			        selection
			1 to 112: Item (1 data) selected in the setting item 1
			        to 7 selection
			        Only the data (one data) of the selected item
			is read or written. However, since communication
			with the PLC is a batch process, all the selected
			items are read or written.

Setting request command (*)	D1106	R/W	B0: Setting request (PLC → QMC1)
			     QMC1 requests to read the data of the setting
			     item of PLC register.
			B1: Monitoring request (QMC1 → PLC)
			     QMC1 requests to write the data of the setting
			     item to the PLC register.
			After the setting request or monitoring request is
			completed, QMC1 clears each bit.

Reservation	D1107	R/W	
Reservation	D1108	R/W	
Reservation	D1109	R/W	

(*): When setting request and monitoring request are set at the same time, processing is done in the
      order of setting request (reading PLC register data for QMC1) and monitoring request (writing
      data to PLC register).
      If the setting request is set during the monitoring request, the monitor request is discarded and
      the monitoring request is made again after the setting request.

Module 1, Module 2   Details of monitoring item and setting item between QMC1 and PLC

Module 1   QTC1-40 (Slave)

Data item	Channel	PLC Data register	Attribute	Data
PV reading (including difference)	CH1 CH2 CH3 CH4	D1010 D1011 D1012 D1013	RO	Value of control range (*) Corresponding to Input calculation function (Difference input, Addition input) and Input difference detection

14.7.6 Exchange of data between QMC1 and PLC

Data is exchanged between QMC1 and PLC by the setting request item number and setting request command.

(1)   Setting request item number

Set whether to transfer the data of all items selected by setting items 1 to 7 or only the data (1 data) of the selected item.

0:          The data of all items selected by setting items 1 to 7 is transferred.

1 to 112: Transfers only the data (1 data) of the item selected by setting items 1 to 7.

(2)   Setting request command

The setting request command is a setting request and a monitoring request.

B0: Setting request (PLC → QMC1)

This command requests QMC1 to read out the data of the setting item of PLC register.

B1: Monitoring request (QMC1 → PLC)

This command requests QMC1 to write the data of the setting item to the PLC register.

When setting request and monitoring request are set at the same time, processing is done in the order of setting request (reading PLC register data for QMC1) and monitoring request (writing data to PLC register).

If the setting request is set during the monitoring request, the monitor request is discarded and the monitoring request is made again after the setting request.

14.7.7 Data Settings

┌───┐
│ ⚠ **Caution**   │
│   │
│ When setting data, write all the data of the setting items to the PLC register first. │
│   │
│ If you change the setting items of the QTC1-40 without writing all the data of the setting items, they │
│ may be rewritten to indefinite values and malfunction may occur.   │
└───┘

Data setting procedure

Module 1   When selecting "control allowed" in the control allowed/prohibited selection of QTC1-40.

(1) Set 0 to the setting request item number

To write all the data of the setting items to the PLC register, set 0 to D1005 (setting request item number).

(2) Set B1 (monitoring request) of setting request command

Set 1 (decimal: 2) to B1 (monitoring request) of D1006 (setting request command).

QMC1 starts to write the data of the setting item to the PLC register.

(3) Check B1 (monitoring request) of setting request command

B1 (monitoring request) of D1006 (setting request command) is cleared when writing the data of the setting item to the PLC register is completed.

(4) Data setting

Set 1 (control allowed) to D1030 to D1033 (control allowed/prohibited selection) in the PLC register.

(5) Set 1 to the setting request item number

To read out the control allowed/prohibited selection data in the PLC register, set 1 to D1005 (setting request item number).

(6) Set B0 (setting request) of setting request command

Set 1 (decimal: 1) to B0 (setting request) of D1006 (setting request command).

QMC1 starts to read the data of the setting item of PLC register.

(7) Check B0 (setting request) of setting request command

B0 (setting request) of D1006 (setting request command) is cleared when reading the data of the setting item to the PLC register is completed.

14.8 Communication with PLC Manufactured by OMRON Corporation

This section describes communication with the PLC manufactured by OMRON Corporation.

14.8.1 Communication parameter setting

The communication parameter settings should be set as follows.

For details, refer to the instruction manual of the PLC to be used.

Setting item	Setting description
Serial communication mode	Host link
Unit No.	0
Data bits	7 bits
Parity bit	With parity/even
Stop bit	2 bits
Communication speed setting	Same setting as this instrument
Termination resistor ON/OFF	ON
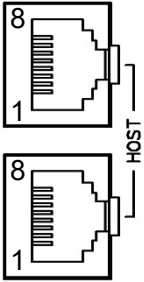

14.8.2 Connecting PLC and QMC1

When connecting to an OMRON PLC with the SIF function, the RS-485 communication type cannot be used. Only RS-422A communication type can be connected.

Serial communication connector pin assignment

The pin assignment of the serial communication connector is as follows

The connector is common to the upper and lower sections.

Pin No. / Model	QMC1-C4☐-☐
8	NC
7	SG
6	RD(+)
5	SD(+)
4	SD(-)
3	RD(-)
2	SG
1	NC

Serial communication connector

(Fig. 14.8.2-1)

For RS-422A

Use the communication cable CQM-002 (sold separately) for connection.
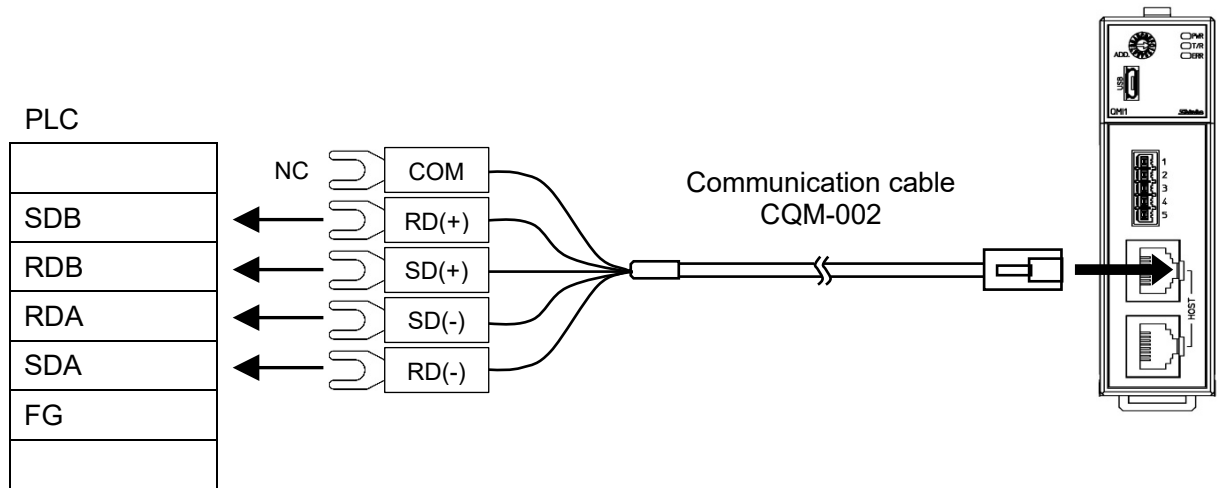

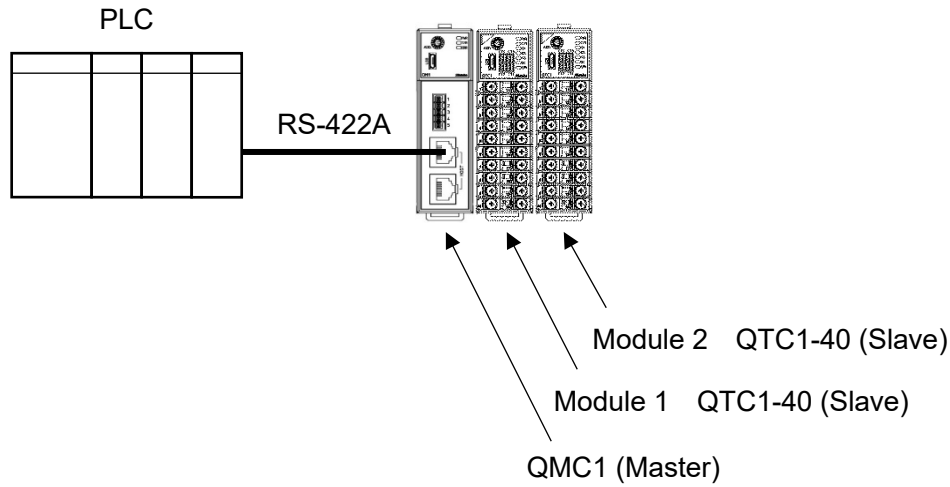

PLC

	NC — COM
SDB	← RD(+)
RDB	← SD(+)
RDA	← SD(-)
SDA	← RD(-)
FG	

Communication cable
CQM-002

For details of the PLC side terminals, refer to the instruction manual of the PLC to be used.

(Fig. 14.8.2-2)

14.8.3 Communication Procedure

This section describes the case where this instrument and two QTC1-40 modules are connected to PLC.

Module 2   QTC1-40 (Slave)

Module 1   QTC1-40 (Slave)

QMC1 (Master)

(Fig. 14.8.3-1)

(1) This instrument becomes the master and collects the valid monitor items and setting items of module 1 and module 2 [QTC1-40 (slave)].

(2) After the PLC communication start waiting time elapses, this instrument periodically writes the item selected in the monitor item to the PLC register.
In addition, the item selected in the setting item is read from the PLC register by the setting request.

PLC	QMC1 (Master)	Module 1 QTC1-40 (Slave)	Module 2 QTC1-40 (Slave)

All items   Reading items: Items selected by monitoring item selection
Writing items: At startup: Items selected by setting item selection
After startup: Items set by setting request item number
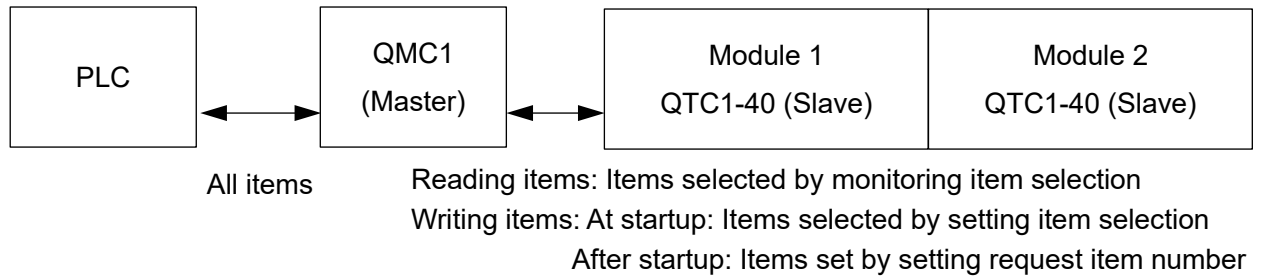

(Fig. 14.8.3-2)

14.8.4 Handshake between QMC1 and PLC

After the PLC communication start waiting time elapses, QMC1 reads the system data in PLC registers 0 to 9.

When QMC1 completes data collection, the communication status becomes 1, and it is ready to communicate with the PLC.

QMC1 writes system data to PLC registers 0 to 4.

QMC1 writes the monitoring item in PLC registers 10 to 49. However, if it is not selected in the monitoring item selection, it is skipped.

QMC1 writes the monitoring item in PLC registers 50 to 89. However, if it is not selected in the monitoring item selection, it is skipped.

QMC1 reads the data of the setting item of PLC register 90 to 129. However, if the setting request of the setting request command is not set, it is skipped.

QMC1 reads the data of the setting item of PLC register 130 to 169. However, if the setting request of the setting request command is not set, it is skipped.

QMC1 writes the data of the setting item to PLC registers 90 to 129. However, if the monitor request of the setting request command is not set, it is skipped.

QMC1 writes the data of the setting item to PLC registers 130 to 169. However, if the monitor request of the setting request command is not set, it is skipped.

PLC data register layout

	Module 1 QTC1-40 (Slave)	Module 2 QTC1-40 (Slave)
Information between QMC1 and PLC (System data)	DM1000 to DM1009	DM1100 to DM1109
Monitor item	DM1010 to DM1029	DM1110 to DM1129
Setting item	DM1030 to DM1085	DM1130 to DM1185

Details of information between QMC1 and PLC (System data)

Module 1　QTC1-40 (Slave)

Data	PLC Data register	Attribute	Description
Communication status	DM1000	RO	0:　QMC1 is collecting data from QTC1-40. 1:　QMC1 completed data collection for QTC1-40 　　(At startup: Initial setting values for each slave)
QMC1 - PLC Normal communication monitor	DM1001	RO	Increment counter Repeat 0 to 65535　→　0 to 65535
QMC1 Error code	DM1002	RO	B0:　PLC register R/W error　　0: Normal　1: Error B1:　Between QMC1 and PLC communication error 　　　　　　　　　　　　　0: Normal　1: Error B2:　Negative acknowledgement when setting from QMC1 to QTC1-40 　　(Cleared at B0 clear of 1006) 　　　　　　　　　　　　　0: Normal　1: Error
Setting request monitor	DM1003	RO	B0:　At setting (Reflect and set to B0 of 1006.) B1:　At monitoring (Reflect and set until B1 of 1006 is cleared.)
Reservation	DM1004	RO	
Setting request item number	DM1005	R/W	0:　　　All items selected in the setting item 1 to 7 selection 1 to 112: Item (1 data) selected in the setting item 1 to 7 selection 　　Only the data (one data) of the selected item is read or written. However, since communication with the PLC is a batch process, all the selected items are read or written.
Setting request command (*)	DM1006	R/W	B0:　Setting request (PLC → QMC1) 　　QMC1 requests to read the data of the setting item of PLC register. B1:　Monitoring request (QMC1 → PLC) 　　QMC1 requests to write the data of the setting item to the PLC register. After the setting request or monitoring request is completed, QMC1 clears each bit.
Reservation	DM1007	R/W	
Reservation	DM1008	R/W	
Reservation	DM1009	R/W	

(*):　When setting request and monitoring request are set at the same time, processing is done in the order of setting request (reading PLC register data for QMC1) and monitoring request (writing data to PLC register).

If the setting request is set during the monitoring request, the monitor request is discarded and the monitoring request is made again after the setting request.

Module 2   QTC1-40 (Slave)

Data	PLC Data register	Attribute	Description
Communication status	DM1100	RO	0: QMC1 is collecting data from QTC1-40. 1: QMC1 completed data collection for QTC1-40 (At startup: Initial setting values for each slave)
QMC1 - PLC Normal communication monitor	DM1101	RO	Increment counter Repeat 0 to 65535 → 0 to 65535

QMC1 Error code	DM1102	RO	B0: PLC register R/W error 0: Normal 1: Error
			B1: Between QMC1 and PLC communication error
			                                        0: Normal 1: Error
			B2: Negative acknowledgement when setting from
			      QMC1 to QTC1-40
			      (Cleared at B0 clear of 1006)
			                                        0: Normal 1: Error

Setting request monitor	DM1103	RO	B0: At setting (Reflect and set to B0 of 1006.) B1: At monitoring (Reflect and set until B1 of 1006 is cleared.)
Reservation	DM1104	RO	

Setting request item number	DM1105	R/W	0: All items selected in the setting item 1 to 7
			            selection
			1 to 112: Item (1 data) selected in the setting item 1
			            to 7 selection
			            Only the data (one data) of the selected item
			is read or written. However, since communication
			with the PLC is a batch process, all the selected
			items are read or written.

Setting request command (*)	DM1106	R/W	B0: Setting request (PLC → QMC1)
			      QMC1 requests to read the data of the setting
			      item of PLC register.
			B1: Monitoring request (QMC1 → PLC)
			      QMC1 requests to write the data of the setting
			      item to the PLC register.
			After the setting request or monitoring request is
			completed, QMC1 clears each bit.

Reservation	DM1107	R/W	
Reservation	DM1108	R/W	
Reservation	DM1109	R/W	

(*): When setting request and monitoring request are set at the same time, processing is done in the order of setting request (reading PLC register data for QMC1) and monitoring request (writing data to PLC register).

If the setting request is set during the monitoring request, the monitor request is discarded and the monitoring request is made again after the setting request.

Module 1, Module 2 Details of monitoring item and setting item between QMC1 and PLC

Module 1 QTC1-40 (Slave)

Data item	Channel	PLC Data register	Attribute	Data
PV reading (including difference)	CH1 CH2 CH3 CH4	DM1010 DM1011 DM1012 DM1013	RO	Value of control range (*) Corresponding to Input calculation function (Difference input, Addition input) and Input difference detection

14.8.6 Exchange of data between QMC1 and PLC

Data is exchanged between QMC1 and PLC by the setting request item number and setting request command.

(1) Setting request item number

Set whether to transfer the data of all items selected by setting items 1 to 7 or only the data (1 data) of the selected item.

0:          The data of all items selected by setting items 1 to 7 is transferred.

1 to 112: Transfers only the data (1 data) of the item selected by setting items 1 to 7.

(2) Setting request command

The setting request command is a setting request and a monitoring request.

B0: Setting request (PLC → QMC1)

This command requests QMC1 to read out the data of the setting item of PLC register.

B1: Monitoring request (QMC1 → PLC)

This command requests QMC1 to write the data of the setting item to the PLC register.

When setting request and monitoring request are set at the same time, processing is done in the order of setting request (reading PLC register data for QMC1) and monitoring request (writing data to PLC register).

If the setting request is set during the monitoring request, the monitor request is discarded and the monitoring request is made again after the setting request.

14.8.7 Data Settings

> ⚠️ **Caution**
>
> When setting data, write all the data of the setting items to the PLC register first.
>
> If you change the setting items of the QTC1-40 without writing all the data of the setting items, they may be rewritten to indefinite values and malfunction may occur.

Data setting procedure

Module 1   When selecting "control allowed" in the control allowed/prohibited selection of QTC1-40.

(1) Set 0 to the setting request item number

To write all the data of the setting items to the PLC register, set 0 to DM1005 (setting request item number).

(2) Set B1 (monitoring request) of setting request command

Set 1 (decimal: 2) to B1 (monitoring request) of DM1006 (setting request command).

QMC1 starts to write the data of the setting item to the PLC register.

(3) Check B1 (monitoring request) of setting request command

B1 (monitoring request) of DM1006 (setting request command) is cleared when writing the data of the setting item to the PLC register is completed.

(4) Data setting

Set 1 (control allowed) to DM1030 to DM1033 (control allowed/prohibited selection) in the PLC register.

(5) Set 1 to the setting request item number

To read out the control allowed/prohibited selection data in the PLC register, set 1 to DM1005 (setting request item number).

(6) Set B0 (setting request) of setting request command

Set 1 (decimal: 1) to B0 (setting request) of DM1006 (setting request command).

QMC1 starts to read the data of the setting item of PLC register.

(7) Check B0 (setting request) of setting request command

B0 (setting request) of DM1006 (setting request command) is cleared when reading the data of the setting item to the PLC register is completed.

14.9 Communication with PLC Manufactured by KEYENCE CORPORATION

This section describes communication with the PLC manufactured by KEYENCE CORPORATION.

14.9.1 Communication parameter setting

The communication parameter settings should be set as follows.

For details, refer to the instruction manual of the PLC to be used.

| Setting item	Setting description
Station No.	00
Operation mode	KV mode (host link)
Data bits	8 bits
Parity bit	With parity/even
Stop bit	1 bit
Checksum	None
Baud rate	Set the same communication speed as this instrument.

14.9.2 Connecting PLC and QMC1

When connecting to an KEYENCE PLC with the SIF function, the RS-485 communication type cannot be used. Only RS-422A communication type can be connected.

Serial communication connector pin assignment

The pin assignment of the serial communication connector differs depending on the model name.

The connector is common to the upper and lower sections.

Pin No. \ Model	QMC1-C4□-□
8	NC
7	SG
6	RD(+)
5	SD(+)
4	SD(-)
3	RD(-)
2	SG
1	NC

Serial communication connector

(Fig. 14.9.2-1)

For RS-422A

Use the communication cable CQM-002 (sold separately) for connection.
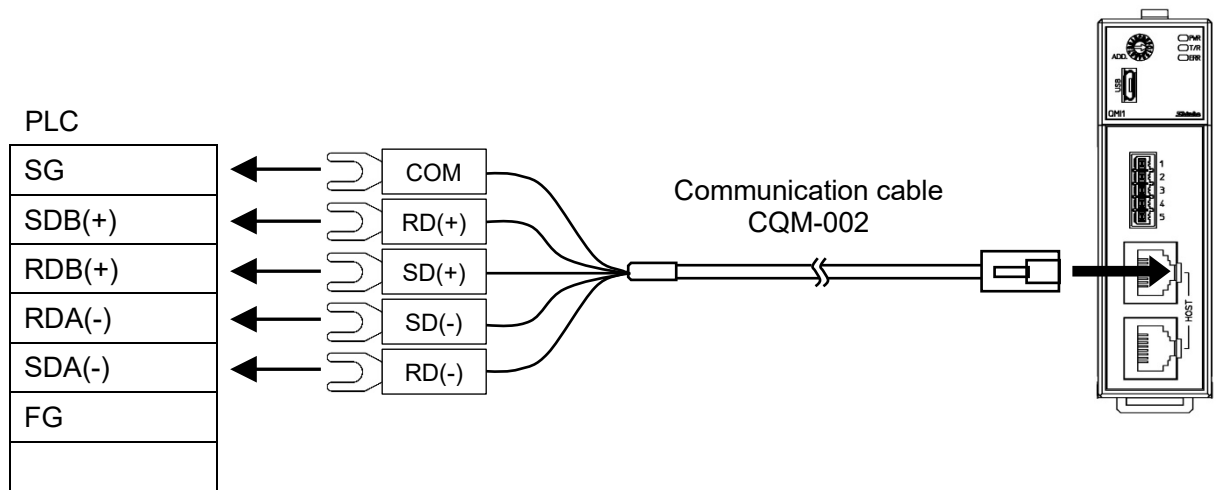

PLC

SG	←	COM
SDB(+)	←	RD(+)
RDB(+)	←	SD(+)
RDA(-)	←	SD(-)
SDA(-)	←	RD(-)
FG		

Communication cable
CQM-002

For details of the PLC side terminals, refer to the instruction manual of the PLC to be used.

(Fig. 14.9.2-2)

14.9.3 Communication Procedure

This section describes the case where this instrument and two QTC1-40 modules are connected to PLC.

(Fig. 14.9.3-1)

(1) This instrument becomes the master and collects the valid monitor items and setting items of module 1 and module 2 [QTC1-40 (slave)].

(2) After the PLC communication start waiting time elapses, this instrument periodically writes the item selected in the monitor item to the PLC register.

In addition, the item selected in the setting item is read from the PLC register by the setting request.

All items   Reading items: Items selected by monitoring item selection
Writing items: At startup: Items selected by setting item selection
After startup: Items set by setting request item number
(Fig. 14.9.3-2)

14.9.4 Handshake between QMC1 and PLC

```

After the PLC communication start waiting time elapses, QMC1 reads the system data in PLC registers 0 to 9.

When QMC1 completes data collection, the communication status becomes 1, and it is ready to communicate with the PLC.

QMC1 writes system data to PLC registers 0 to 4.

QMC1 writes the monitoring item in PLC registers 10 to 49. However, if it is not selected in the monitoring item selection, it is skipped.

QMC1 writes the monitoring item in PLC registers 50 to 89. However, if it is not selected in the monitoring item selection, it is skipped.

QMC1 reads the data of the setting item of PLC register 90 to 129. However, if the setting request of the setting request command is not set, it is skipped.

QMC1 reads the data of the setting item of PLC register 130 to 169. However, if the setting request of the setting request command is not set, it is skipped.

QMC1 writes the data of the setting item to PLC registers 90 to 129. However, if the monitor request of the setting request command is not set, it is skipped.

QMC1 writes the data of the setting item to PLC registers 130 to 169. However, if the monitor request of the setting request command is not set, it is skipped.

14.9.6 Exchange of data between QMC1 and PLC

Data is exchanged between QMC1 and PLC by the setting request item number and setting request command.

(1) Setting request item number

Set whether to transfer the data of all items selected by setting items 1 to 7 or only the data (1 data) of the selected item.

0:          The data of all items selected by setting items 1 to 7 is transferred.

1 to 112: Transfers only the data (1 data) of the item selected by setting items 1 to 7.

(2) Setting request command

The setting request command is a setting request and a monitoring request.

B0: Setting request (PLC → QMC1)

This command requests QMC1 to read out the data of the setting item of PLC register.

B1: Monitoring request (QMC1 → PLC)

This command requests QMC1 to write the data of the setting item to the PLC register.

When setting request and monitoring request are set at the same time, processing is done in the order of setting request (reading PLC register data for QMC1) and monitoring request (writing data to PLC register).

If the setting request is set during the monitoring request, the monitor request is discarded and the monitoring request is made again after the setting request.

⚠ **Caution**

When setting data, write all the data of the setting items to the PLC register first.

If you change the setting items of the QTC1-40 without writing all the data of the setting items, they may be rewritten to indefinite values and malfunction may occur.

Data setting procedure

Module 1   When selecting "control allowed" in the control allowed/prohibited selection of QTC1-40.

(1) Set 0 to the setting request item number

To write all the data of the setting items to the PLC register, set 0 to DM1005 (setting request item number).

(2) Set B1 (monitoring request) of setting request command

Set 1 (decimal: 2) to B1 (monitoring request) of DM1006 (setting request command).

QMC1 starts to write the data of the setting item to the PLC register.

(3) Check B1 (monitoring request) of setting request command

B1 (monitoring request) of DM1006 (setting request command) is cleared when writing the data of the setting item to the PLC register is completed.

(4) Data setting

Set 1 (control allowed) to DM1030 to DM1033 (control allowed/prohibited selection) in the PLC register.

(5) Set 1 to the setting request item number

To read out the control allowed/prohibited selection data in the PLC register, set 1 to DM1005 (setting request item number).

(6) Set B0 (setting request) of setting request command

Set 1 (decimal: 1) to B0 (setting request) of DM1006 (setting request command).

QMC1 starts to read the data of the setting item of PLC register.

(7) Check B0 (setting request) of setting request command

B0 (setting request) of DM1006 (setting request command) is cleared when reading the data of the setting item to the PLC register is completed.

15 Specifications

15.1 Standard Specifications

Power supply

Power supply voltage	24 V DC Allowable voltage fluctuation: 20 to 28 V DC
Power consumption	3 W or less
Circuit insulation configuration	Power supply — Host communication / Event output (*) / Event input (*) Functional insulation (*): When option is added When event input / output is added at the same time, between event output - power supply is not insulated.
Insulation resistance	500 V DC 10 MΩ or more
Dielectric strength	Between Power terminal – Ground (GND): 1.5 kV AC for 1 minute Between Power terminal – Communication: 1.5 kV AC for 1 minute

Communication interface

Between hosts	QMC1-C4: EIA RS-422A QMC1-C5: EIA-485
Between modules	Internal bus

Event input / output

Event input		
	Input points	4 points or 2 points
	Input type	Voltage contact input sink type
	Circuit current when closed	Approx. 6 mA
	Import judgment time	Approx. 100 ms
Event output		
	Output points	4 points or 2 points
	Circuit	NPN open collector
	Max. load voltage	30 V DC
	Max. load capacity	50 mA

Recommended Environment

Ambient temperature	-10 to 55 °C (no condensation or freezing)
Ambient humidity	35 to 85 %RH (no condensation)
Environmental specification	RoHS directive compliant (RoHS2)

General Structure

Weight	Approx. 130 g
External dimensions	30 × 100 × 85 mm (W × H × D)
Mounting type	DIN rail mounting type
Case	Flame-resistant resin, Color: Black
Panel	Polycarbonate sheet
Applicable standard	

EN	EN61010-1 (Pollution degree 2, overvoltage category II)
EC Directive	EMI: EN61326 Radiated interference field strength: EN55011 Group1 ClassA Terminal noise voltage: EN55011 Group1 ClassA EMS: EN61326

Setting Structure

Communication specification selection	Select the communication speed, data bit, parity, and stop bit using the DIP switch.
Module address selection	Select the module address 0 to F (1 to 16) with the rotary switch. For QMC1-□□□-0 [Console selection (MODBUS RTU)] The value obtained by adding 1 to the value of the selected rotary switch becomes the module address. For QMC1-□□□-1 (C SERIES COMPATIBLE) The value of the selected rotary switch becomes the module address.

Standard Function

Host-to-module communication	Relay communication between the external computer or PLC made by each company and this instrument.	
	Communication line	EIA RS-422A, EIA RS-485
	Communication method	Half-duplex communication
	Synchronization method	Start-stop synchronization
	Communication speed	9600 bps, 19200 bps, 38400 bps or 57600 bps can be selected by DIP switch
	Data bit/Parity/Stop bit	Select the following with the DIP switch Data bit: 8 Parity: Even, Odd, No parity Stop bit: 1 or 2
	Communication response delay time	Set the delay time to return the response from this instrument after receiving the command from the host. 0 to 1000 ms
	Number of connections	This instrument: Max 16 modules For C SERIES COMPATIBLE, max 5 modules
	SIF function	A function to read and write various data to PLC registers using the communication protocol of PLCs made by each company.
	Communication protocol MODBUS RTU protocol , C SERIES COMPATIBLE protocol	
Module-to-module communication		
	Communication line	Internal Bus
	Communication method	Half-duplex communication
	Synchronization method	Start-stop synchronization
	Communication speed	57600 bps
	Data bit/Parity/Stop bit	Data bit: 8 Parity: Even Stop bit: 1

Attached Function

Power failure countermeasure	The setting data is backed up in the non-volatile IC memory.
Self-diagnosis	The CPU is monitored by a watchdog timer, and if an abnormal status occurs, the controller is switched to warm-up status, turning all outputs OFF.
Warm up indication	The power indicator flashes every 500 ms for about 3 seconds after the power is turned on.
Total energizing time measurement function	It can check the time that the power is on. If the accumulated time exceeds 65535 hours, it will be added from 0 hours. It can grasp the approximate usage time from the accumulated time. However, since the save cycle is 1 hour, the time within 1 hour may not be saved due to a power failure. Total energizing time: 1 hour/count
Console communication	Connect USB communication cable (commercial item) to the console communication connector, and the following operations can be performed from an external computer using the console software (SWC-QMC101M). (1) Reading and setting of host communication protocol, event input allocation and event output allocation (2) Operation status reading (3) Read and set the each setting value of the SIF function (4) Change of function {nested table below}
Firmware update function	Connect USB communication cable (commercial item) to the console communication connector, and the following operations can be performed from an external computer using the console software (SWC-QMC101M).

Nested table within Console communication:

Communication protocol	Shinko protocol
Communication cable	USB - micro USB Type-B (commercial item)
Software	Console software (SWC-QMC101M)

Other Item

Accessories	Mounting and wiring instruction manual: 1 Power supply terminal cover: 1
Sold separately	USB communication cable (CMC-001-4) [USB - Modular] Communication cable (CQM-001) [Y terminal (C5, 3-wire) - Modular] Communication cable (CQM-002) [Y terminal (C4, 5-wire) - Modular] Communication cable (CQQ-001) [Modular - Modular] Wiring connector (0225-0805) [made by DINKLE]

15.2 Optional Specifications

Event input	Operates with the content selected in event input allocation selection.		
	Setting value	Action	Contents
	0	Read status by communication	It can be used for any operation by reading the event input status flag. When the event input □ is turned off, the event input status flag is set to 0, and when the event input □ is turned on, the event input status flag is set to 1.
	1	Control start/stop	Control is started when event input □ is turned on for all channels of all connected QTC1-□0, and control is stoped when event input □ is turned off. However, if control is start/stop by the event input of QTC1-□0, the event input of QTC1-□0 has priority.

Event output	Operates with the content selected in event output allocation selection.		
	Setting value	Action	Contents
	0	Specify event output ON/OFF by communication	Any value can be output by setting a value in the event output status flag from the host. Setting the event output st atus flag to 0 turns off the event output, and setting it to 1 turns on the event output.
	1	Alarm 1	When alarm 1 of any of the connected QTC1-□0 turns ON, the event output □ turns ON.
	2	Alarm 2	When alarm 2 of any of the connected QTC1-□0 turns ON, the event output □ turns ON.
	3	Alarm 3	When alarm 3 of any of the connected QTC1-□0 turns ON, the event output □ turns ON.
	4	Alarm 4	When alarm 4 of any of the connected QTC1-□0 turns ON, the event output □ turns ON.
	5	Heater burnout alarm	When heater burnout alarm of any of the connected QTC1-□0 turns ON, the event output □ turns ON.
	6	Loop break alarm	When loop break alarm of any of the connected QTC1-□0 turns ON, the event output □ turns ON.

16 Troubleshooting

If any malfunctions occur, refer to the following items after checking that power is being supplied to the master module and slave module.

16.1 Communication

Problem	Possible Cause	Solution
Cannot communicate.	Is the communication cable disconnected?	Check the communication cable.
	Is the communication cable wiring correct?	Refer to "7.4 Connection of QMC1 and QTC1-40 to Host Computer (P.7-8, P.7-9)", and check the communication cable.
	Is there any disconnection or contact failure of the communication cable?	Check the communication cable.
	Is communication speed of the master and slave same?	Refer to "5.1 Selection of Communication Specifications (P.5-1, P.5-2)", and check the communication speed of the master and slave.
	Are data bits, parity, and stop bits of the master and slave same?	Refer to "5.1 Selection of Communication Specifications (P.5-1, P.5-2)", and check the data bit, parity, and stop bit of the master and slave.
	Is the module address of the command and slave same?	Refer to "5.2 Selection of Module Address (P.5-3)", and check the module address of the command and slave.
	Are there any slaves that have the same module address?	Refer to "5.2 Selection of Module Address (P.5-3)", and check the module address.
	Is the program considering the transmission timing?	Refer to "9. Communication Procedure (P.9-1)", and check the program.
Communication is possible, but a negative acknowledgement is returned.	Are sending a command code that does not exist?	Refer to "11.1 Communication Command List (P.11-1 to P.11-87)", and check the command code.
	Is the data of the write command exceeding the setting range?	Refer to "11.1 Communication Command List (P.11-1 to P.11-87)", and check the setting range of write command.
	Is it not possible to write (Warming up when power is turned on)?	Check the state of a slave.

16.2 Status Flag

Problem	Possible Cause	Solution
"1: Error" is set in B15: Non-volatile IC memory error.	The nonvolatile IC memory is defective.	Contact our agency or us.

◆If you have any questions, please contact our sales office or branch office.
